ABOUT SMOKING – NEGATIVE PSYCHOSOCIAL EXPECTANCIES

The PROMIS Smoking – Negative Psychosocial Expectancies item banks assess smokers’ beliefs about aspects of social disapproval and disappointment in oneself that are experienced as a result of smoking. These items cover content related to friend and family disapproval (e.g., if I quit smoking my friends will respect me more), self-disapproval (e.g., I get upset when I think about my smoking), and internalization of social norms (e.g., I feel uncomfortable smoking around kids). The Smoking – Negative Psychosocial Expectancies short forms are universal rather than disease-specific. The item banks do not use a time frame (e.g., over the past seven days) when assessing Smoking – Negative Psychosocial Expectancies.

Smoking – Negative Psychosocial Expectancies instruments are available for adults (ages 18+).

Items banks are available for all current smokers (PROMIS Item Bank v1.0 – Smoking – Negative Psychosocial Expectancies for All Smokers), and specifically for daily smokers (PROMIS Item Bank v1.0 – Smoking – Negative Psychosocial Expectancies for Daily Smokers) and nondaily smokers (PROMIS Item Bank v1.0 – Smoking – Negative Psychosocial Expectancies for Nondaily Smokers). The three item banks share 14 common items. There are 6 additional items that are unique to the Daily Smokers bank and 1 additional item that is unique to the Nondaily Smokers bank.

In situations where smoking status is not known prior to computer administration, the All Smokers bank items and scoring algorithms should be used. However, where the smoking status of respondents is known, the Daily Smokers or Nondaily Smokers item banks and scoring algorithms may be more appropriate as these provide additional items and information specific to each status.

One 6-item short form is also available (PROMIS Short Form v1.0 – Smoking – Negative Psychosocial Expectancies for All, Daily, and Nondaily Smokers 6a) and is appropriate for use with all current smokers, regardless of daily/nondaily smoking status.

INTRODUCTION TO ASSESSMENT OPTIONS

There are two administration options for assessing Smoking – Negative Psychosocial Expectancies: short forms and computer adaptive test (CAT). When administering a short form, instruct participants to answer all of the items (i.e., questions or statements) presented. With a CAT, participant responses guide the system’s choice of subsequent items from the full item bank (14 items for the All Smokers bank, 20 items for the Daily Smokers
bank and 15 items for the Nondaily Smokers bank). Although items differ across respondents taking a CAT, scores are comparable across participants.

Some administrators may prefer to ask the same question of all respondents or of the same respondent over time, to enable a more direct comparability across people or time. In these cases, or when paper administration is preferred, a short form would be more desirable than a CAT. This guide provides information on all Smoking – Negative Psychosocial Expectancies short form and CAT instruments.

**CAT:** A minimum number of items (4 for adult CATs) must be answered in order to receive a score for the Smoking – Negative Psychosocial Expectancies CAT. The response to the first item will guide the system’s choice of the next item for the participant. The participant’s response to the second item will dictate the selection of the following question, and so on. As additional items are administered, the potential for error is reduced and confidence in the respondent’s score increases. The CAT will continue until either the standard error drops below a specified level (on the T-score metric 3.0 for adult CATs), or the participant has answered the maximum number of questions (12), whichever occurs first.

**CAT versus Short Form:** Whether one uses a short form or CAT, the score metric is Item Response Theory (IRT), a family of statistical models that link individual questions to a presumed underlying trait or concept of Smoking – Negative Psychosocial Expectancies represented by all items in the item bank. When choosing between a CAT and short form, it is useful to consider the demands of computer-based assessment, and the psychological, physical, and cognitive burden placed on respondents as a result of the number of questions asked.

**SELECTING BETWEEN DAILY, NONDAILY, AND ALL SMOKERS**

In situations where smoking status is not known prior to administration, the All Smokers item banks and scoring algorithms should be used. However, when the smoking status of respondents is known, the Daily Smokers or Nondaily Smokers item banks and scoring algorithms may be more appropriate as these provide additional items and information specific to each status. Short forms are appropriate for use with all current smokers, regardless of daily/nondaily smoking status.
SCORES
For most PROMIS instruments, a T-score of 50 is the average for the United States general population with a standard deviation of 10 because calibration testing was performed on the general population. However, the PROMIS Smoking instruments were developed with samples of smokers drawn from the general population. You can read more about the calibration and centering samples at HealthMeasures.net in the Interpret PROMIS (http://www.healthmeasures.net/score-and-interpret/interpret-scores/promis) section. The T-score is provided with an error term (Standard Error or SE). The Standard Error is a statistical measure of variance and represents the “margin of error” for the T-score.

Important: A higher PROMIS T-score represents more of the concept being measured. For a concept like Negative Psychosocial Expectancies, a T-score of 60 is one SD better than average. This means one is likely to be aware of the social disapproval and may experience self-disappointment as a result of smoking. By comparison, a Negative Psychosocial Expectancies T-score of 40 is one SD worse than average. This means one does not believe or experience social disapproval and disappointment because of smoking.

STATISTICAL CHARACTERISTICS
There are four key features of the score for Smoking – Negative Psychosocial Expectancies:

- **Reliability**: The degree to which a measure is free of error. It can be estimated by the internal consistency of the responses to the measure, or by correlating total scores on the measure from two time points when there has been no true change in what is being measured (for z-scores, reliability = 1 – SE²).
- **Precision**: The consistency of the estimated score (reciprocal of error variance).
- **Information**: The precision of an item or multiple items at different levels of the underlying continuum (for z-scores, information = 1/SE²).
- **Standard Error (SE)**: The possible range of the actual final score based upon the scaled T-score. For example, with a T-score of 52 and a SE of 2, the 95% confidence interval around the actual final score ranges from 48.1 to 55.9 (T-score ± (1.96*SE) = 52 ± 3.9 = 48.1 to 55.9).

The final score is represented by the T-score, a standardized score with a mean of 50 and a standard deviation (SD) of 10.

In Figure 2 (Adult 6a Daily and Nondaily short form), the two dotted horizontal lines each represent a degree of internal consistency reliability (i.e., .80 or .90) typically regarded as sufficient for an accurate individual score. The shaded blue region marks the range of the scale where measurement precision is comparable to the reliability of .80 for the six-item form. Figure 2 also tells us where on the scale the form is most informative based upon the T-score.

More information is available at www.HealthMeasures.net.
PREVIEW OF SAMPLE ITEM
Figure 3 is an excerpt from the paper version of the adult six-item short form. This is the paper version format used for all Smoking – Negative Psychosocial Expectancies instruments. It is important to note that the CAT is not available for paper administration.

FREQUENTLY ASKED QUESTIONS (FAQs)
Q: I am interested in learning more. Where can I do that?
Review the HealthMeasures website at www.healthmeasures.net.

Q: Are these instruments available in other languages?

Q: Can I make my own short form?
Yes, custom short forms can be made by selecting any items from an item bank. This can be scored using the Scoring Service (https://www.assessmentcenter.net/ac_scoringservice).
