Overview

The National Institute of Neurological Disorders and Stroke (NINDS) funded Neuro-QoL to create a clinically-relevant and psychometrically-robust health-related quality of life (HRQL) assessment tool for both adults and children. The specific goals of Neuro-QoL include: (1) the development of a core set of questions that address dimensions of HRQL that are universal to patients with chronic neurological disorders, (2) the development of supplemental questions that address HRQL concerns specific to particular groups of patients based on disease status and other sociodemographic variables such as age and ethnicity, and (3) to create a publically available, adaptable and sustainable system, which allows clinical researchers to have access to a common item repository and be able to administer computerized adaptive testing (CAT). The measures are intended to be responsive to the needs of researchers that are working with a variety of neurological disorders across a wide range of settings, which enables the facilitation of comparisons of data across clinical trials that focus on disparate diseases. The Neuro-QoL items, item banks, and scales are the result of a rigorous development process that included literature review, qualitative and cognitive interviewing, general population and clinical population testing, and state-of-the-art item response theory (IRT) analyses. The purpose of this Technical Report is to provide the reader with information about the methodology used to create Neuro-QoL, and to provide psychometric information for the items, scales, and banks that comprise Neuro-QoL.

Development of item banks

Based on our assessment of the needs of NINDS-funded researchers, Neuro-QoL focused on five adult conditions (stroke, multiple sclerosis, Parkinson's disease, epilepsy, and amyotrophic lateral sclerosis [ALS]) and two pediatric conditions (epilepsy and muscular dystrophy). The Neuro-QoL item banks and scales were created using a rigorous set of steps, which were guided by best practices, very similar to those used in the National Institutes of Health (NIH) Patient-Reported Outcomes Management Information System (PROMIS) initiative,¹⁻⁵ as well as guidance from the Food and Drug Administration on the creation of patient-reported outcomes to be used in clinical trials, which in turn are used to support label claims for medications and other medical interventions.⁶ There were six phases of item development: 1) identification of extant items, using a systematic search for existing questions in currently available scales, 2) item classification and selection, 3) item review and revision by trained professionals who reviewed the wording of each question and revised them in accord with conventions adopted by the Neuro-QoL group, 4) focus group input on domain coverage to confirm domain definitions and to identify new areas of item development for future item banks, 5) cognitive interviews with patients to assess their understanding of individual items, and 6) final revision before field testing. Questions that survived this process were field tested and their psychometric properties were evaluated using classical test theory and item response theory models.

The list of adult and pediatric Neuro-QoL domains is listed in Tables 1 and 2, respectively.

Table 1 – Neuro-QoL Domains for Adults

| | | |
|-----------------|---|---|
| Physical | Function/Health | Upper Extremity Function – Fine Motor, ADL (Bank) One's ability to carry out various activities involving digital, manual and reach-related functions, ranging from fine motor to self-care (activities of daily living). |
| | | Lower Extremity Function – Mobility (Bank) One's ability to carry out various activities involving the trunk region and increasing degrees of bodily movement, ambulation, balance or endurance. |
| | | Bowel/Bladder Function (Item Pool) Functional problems related to storage and emptying, such as incontinence or constipation, urgency, leakage and discomfort. |
| | | Sexual Function (Item Pool) A person's overall evaluation of, satisfaction with and quality of sexual activities, including interest, discomfort, functioning and ability to achieve orgasm. |
| | Symptoms | Fatigue (Bank) Sensations ranging from tiredness to an overwhelming, debilitating and sustained sense of exhaustion that decreases one's capacity for physical, functional, social and mental activities. |
| | | Sleep Disturbance (Bank) Perceptions of sleep quality, sleep depth, and restoration associated with sleep; perceived difficulties with getting to sleep or staying asleep; and perceptions of the adequacy of and satisfaction with sleep. |
| Mental | Emotional Health | Depression (Bank) Experience of loss and feelings of hopelessness, negative mood (e.g., sadness, guilt), decrease in positive affect (e.g., loss of interest), information-processing deficits (e.g., problems in decision-making), negative views of the self (e.g., self-criticism, worthlessness), and negative social cognition (e.g., loneliness). |
| | | Anxiety (Bank) Unpleasant thoughts and/or feelings related to fear (e.g., fearfulness, feelings of panic), helplessness, worry and hyperarousal (e.g., tension, nervousness, restlessness). |
| | | Stigma (Bank) Perceptions of self and publically enacted negativity, prejudice and discrimination as a result of disease-related manifestations. |
| | | Positive Affect and Well-Being (Bank) Aspects of a person's life that relate to a sense of well-being, life satisfaction or an overall sense of purpose and meaning. |
| | | Emotional and Behavioral Dyscontrol (Bank) A set of disease and/or treatment related manifestations including disinhibition, emotional lability, irritability, impatience, and impulsiveness. |
| | | End of Life Concerns (Pending) Issues and concerns that emerge at the end of one's life (including basic functioning across physical, social, emotional, cognitive and existential domains, as well as overall satisfaction with care and symptom palliation). |
| | Cognitive Health | Cognitive Function (Bank)* Perceived difficulties in cognitive abilities (e.g., memory, attention, and decision making, or in the application of such abilities to everyday tasks (e.g., planning, organizing, calculating, remembering and learning). |
| | | Communication (Scale) Perceived difficulties related to oral expression, language production, articulation, comprehension and organization. |
| Social | Ability to Participate in Social Roles and Activities (Bank) Degree of involvement in one's usual social roles, activities and responsibilities, including work, family, friends and leisure. | |
| | Satisfaction with Social Roles and Activities (Bank) Satisfaction with involvement in one's usual social roles, activities and responsibilities, including work, family, friends and leisure. | |

***The Cognitive Function item bank consists of Applied Cognition – General Concerns and Applied Cognition - Executive Function banks from Neuro-QoL version 1., which were jointly co-calibrated in the current version 2.**

Table 2 – Neuro-QoL Domains for Pediatric Populations

| | | |
|----------------------|--|---|
| Physical | Function/Health | Upper Extremity Function – Fine Motor, ADL (Uncalibrated scale) One's ability to carry out various activities involving digital, manual and reach-related functions, ranging from fine motor to self-care (activities of daily living). |
| | | Lower Extremity Function – Mobility (Uncalibrated scale) One's ability to carry out various activities involving the trunk region and increasing degrees of bodily movement, ambulation, balance or endurance. |
| | Symptoms | Fatigue (Bank) Sensations ranging from tiredness to an overwhelming, debilitating and sustained sense of exhaustion that decreases one's capacity for physical, functional, social and mental activities. |
| | | Pain (Bank) An unpleasant sensory or emotional experience associated with actual or potential tissue damage, or described in terms of such damage. Conceptually divided into components of quality (e.g. the nature, characteristics, intensity, frequency, and duration of pain), behaviors (e.g. verbal and nonverbal actions that communicate pain to others) and interference (e.g. impact of pain on physical, mental, and social activities). |
| Mental | Emotional Health | Depression (Bank) Experience of loss and feelings of hopelessness, negative mood (e.g., sadness, guilt), decrease in positive affect (e.g., loss of interest), information-processing deficits (e.g., problems in decision-making), negative views of the self (e.g., self-criticism, worthlessness), and negative social cognition (e.g., loneliness). |
| | | Anxiety (Bank) Unpleasant thoughts and/or feelings related to fear (e.g., fearfulness, feelings of panic), helplessness, worry and hyperarousal (e.g., tension, nervousness, restlessness). |
| | | Stigma (Bank) Perceptions of self and publically enacted negativity, prejudice and discrimination as a result disease-related manifestations. |
| | | Anger (short form) Angry mood (e.g., irritability, frustration), verbal aggression, and efforts to control anger. |
| | Cognitive Health | Cognitive Function (Bank)* Perceived difficulties in everyday cognitive abilities such as memory, attention, concentration, processing speed and organization skill. |
| Social Health | Social Relations – Interaction with Peers (Bank) Degree of involvement with one's peers in usual social roles, activities and responsibilities | |
| | Social Relations – Interaction with Adults (uncalibrated) Degree of involvement with adults in one's usual social roles, activities and responsibilities | |

*The pediatric Cognitive Function v2.0 bank was originally named Applied Cognition – General Concerns v1.0. The items are the same, but the calibrations are different.

Neuro-QoL investigators and expert consultants identified candidate instruments and items via literature searches and previous item banking projects (e.g., PROMIS; Cella, et al.2010).² Our team created an item library, which included information on the time frame of the response requested, the exact wording of the item stem and response options, and any context (e.g., specific instructions) for the respondent to consider when answering questions. For each domain, the investigative team constructed a comprehensive item pool. Some items included in the Neuro-QoL library are from the NIH PROMIS and the Activity Measure for Post Acute Care.⁷ Teams of three or more domain experts then assigned items to the Neuro-QoL domains through an iterative, multi-step process. We then organized items into domains, sub-domains, factors, and facets, and then reviewed items to determine if they should proceed through detailed item review, revision, and testing.

Once all items were assigned to a domain area, content experts systematically removed items from individual pools. Content experts removed items when there was apparent semantic redundancy. In these cases, we selected the item that was more consistent with the concept definition, or the item that was clearest. Some items in development were found to lack cultural relevance or sensitivity, to lack gender neutrality, to be difficult to translate, or to exhibit excessive disease specificity. We discarded these items. Items that survived this initial review underwent a subsequent, more thorough review, which was conducted by two scientists appointed as co-chairs of the content domain, as well as additional, independent content experts. We also revised the majority of the items to ensure general consistency across banks, to assure comprehensiveness in measuring the domain, to ensure clear, understandable and precise language, to easily facilitate linguistic translation, and to maintain adaptability to the data collection and analysis strategies planned.

Teams of domain experts reviewed and synthesized findings to make further decisions about which items to carry forward in testing. Final item pools were reviewed by 63 patients with neurological disorders using telephone-based cognitive interviews in English and Spanish to assess the content validity of items, clarify concepts, and refine language and response options. During interviews, patients reviewed each item in individual semi-structured interviews that focused on item comprehension and relevance. Patients and experts also identified areas for new item development, for which additional items were written or revised. For children, cognitive interviews were conducted with individuals aged 10-18. Overall, the primary goal was to use the data to better understand the dimensional structure of items that specifically pertained to the various domain areas of Neuro-QoL. Additionally, the results informed the revision of items in the item pools and facilitated new item development prior to the first wave of testing.

Sampling and Pilot Testing

Adult samples

A complete discussion of the development and testing of adult items is discussed in Gershon et al.⁸ Data collection occurred in two waves. The first wave was divided into two parts. Testing from January 31, 2008 to March 10, 2008 is referred to as Wave 1a, and included clinical samples for domains targeted to certain neurological conditions. Wave 1b occurred from September 11, 2008 to September 24, 2008, and was sampled from the U.S. general population. Wave 2 validation testing occurred from January 15, 2009 to January 30, 2010, and included clinical samples. The sampling plan facilitated obtaining item calibrations for the different domain areas, estimating profile scores for varied subgroups, confirming factor structure, and conducting item and bank analyses. We had over 500 candidate items, so participants could not respond to all of the items. We estimated that participants would respond to four questions per minute, with the maximum number of items administered for each respondent approximately 150. This led to a response time on average of 37 minutes.

For Wave 1a, the response data were collected by YouGovPolimetrix (www.polimetrix.com). Their standard respondent pool for an internet-based survey is taken from a predetermined panel of people who typically respond to the company's online surveys. Chosen panelists receive modest compensation (under a \$10 value) for their participation. Wave 1b data was collected through Greenfield Online, which is also an online panel organization, who offers a similar service to YouGovPolimetrix. Greenfield Online was chosen for Wave 1b because their services proved more economical for this particular sample and they use a similar method to YouGovPolimetrix.

All participants completed a socio-demographic form consisting of approximately 20 auxiliary items that measured global health perceptions, and socio-demographic variables including age, gender, race/ethnicity, relationship status, educational attainment, and employment status, income, number of hospitalizations, disability days, use of prescription medication, height, weight. In addition, participants answered a series of health questions about the presence and degree of limitations as they related to multiple neurological conditions affecting adults including stroke, multiple sclerosis, Parkinson's disease, epilepsy and ALS.

For some calibrations, we combined data from multiple samples to overcome difficulties associated with infrequent responses to items and stability of parameter estimates in Item Response Theory models.

The cognitive function items were subsequently tested with an English-speaking adult sample from the general population (PROsetta Stone wave 2). We enlisted the services of an internet survey company (www.op4g.com) that maintains a panel of respondents from the general population. Since Op4G Internet panel respondents were not likely to be representative of the US general population, we imposed in our contracting with them minimum requirements for age, gender, race, ethnicity and education of the participants, to approximate the 2010 US Census distributions. A randomly selected group of adult English-speaking panel members received an e-mail notifying them of a new survey opportunity. After receiving information about the study and providing consent, they completed a set of sociodemographic, education and comorbidity items before filling out the Neuro-QoL items.

The characteristics of the adult calibration samples are provided in Table 3.

Table 3 – Calibration samples for adult items

| Sub-domain | Status | Calibration Sample |
|--|------------------------|---|
| Upper Extremity Function - Fine Motor, ADL | Item bank | Wave 1b (General Population) + Wave 2 |
| Lower Extremity Function - Mobility | Item bank | Wave 1b (General Population) + Wave 2 |
| Urinary/Bladder Function | Item pool – Not tested | <i>Not tested</i> |
| Bowel Function | Item pool – Not tested | <i>Not tested</i> |
| Sexual Function | Item pool – Not tested | <i>Not tested</i> |
| Fatigue | Item bank | Wave 1a |
| Sleep Disturbance | Item bank | Wave 1a + Wave 2 (|
| Depression | Item bank | Wave 1b (General Population) |
| Anxiety | Item bank | Wave 1b (General Population) |
| Stigma | Item bank | Wave 1a |
| Positive Affect and Well-Being | Item bank | Wave 1b |
| Emotional and Behavioral Dyscontrol | Item bank | Wave 1a |
| End of Life Concerns | Item pool – Not tested | <i>Not tested</i> |
| Cognitive Function | Item bank | PROsetta Stone w2 (General Population)* |
| Communication | Item pool | <i>Not calibrated</i> |
| Ability to Participate in Social Roles and Activities | Item bank | Wave 1b |
| Satisfaction with Social Roles and Activities | Item bank | Wave 1b |

* Cognitive Function Item Bank was calibrated using PROsetta Stone w2 sample and then linked to PROMIS Cognitive Function (v2)

Sample sizes:

Note: Some participants were dropped from some IRT analyses due to missing data.

Wave 1a; $N = 553$ clinical participants (stroke, $n = 209$; epilepsy, $n = 183$; multiple sclerosis, $n = 84$; Parkinson's, $n = 59$; ALS, $n = 18$)

Wave 1b; Participants were divided into four groups (A-D). Group A completed the *Ability to Participate in Social Roles and Activities* and *Satisfaction with Social Roles and Activities* items, $N = 549$. Group B completed *Lower Extremity (Mobility)* items and the *Upper Extremity (Fine Motor, ADL)* items, $N = 518$. Group C completed the *Positive Affect and Well-Being*, *Depression*, and *Anxiety* items, $N = 513$. Group D completed the *Applied Cognition – General Concerns* items, $N = 533$.

Wave 2; $N = 581$ clinical participants (stroke, $n = 101$; epilepsy, $n = 119$; multiple sclerosis, $n = 161$; Parkinson's, $n = 120$; ALS, $n = 80$)

PROsetta Stone w2; $N = 1009$ general population

Pediatric samples

A complete discussion of the development and testing of pediatric items is discussed in Lai et al.⁹ Generic domains (emotional health, social health and physical health) were field tested on samples drawn from the U.S. pediatric general population whereas targeted domains (stigma, fatigue, pain and cognition) were field tested on children with either epilepsy or muscular dystrophy. This was done because the generic item pools could be feasibly answered by a person without a medical condition, whereas the targeted item pools are typically symptoms or side effects of a disease process. We recruited the samples from internet panel companies: Greenfield Online (www.greenfield.com) and YouGovPolimetrix (www.polimetrix.com) for the US general population and clinical samples, respectively. Similar recruitment strategies were used by these two companies. Specifically, companies sent e-mails to invite parents of potential participants from their database to participate in the field testing. Potential participants were screened by the companies via internet to ensure their eligibility (i.e., English-speaking, ages of 10-18, and for disease related domains, with a diagnosis of either epilepsy or muscular dystrophy). After parents signed an online consent on behalf of their children, parents were asked to complete a series of sociodemographic and clinical information questions (for disease samples only) and children then completed appropriate Neuro-QoL items. Because of the difficulty in recruiting children with epilepsy and muscular dystrophy via a panel company, we also recruited eligible patients from epilepsy clinics at Children's Memorial Hospital (Chicago, IL), NorthShore University HealthSystem (Evanston, Illinois) and the University of California at Davis Medical Center. One exception is the physical health related domains – Upper Extremity function (Fine motor, ADL) and Lower Extremity function (Mobility). Items written in these two domains were targeted to children with moderate to severe limitations seen in rehabilitation clinics, so we also tested these items in clinical samples in order to minimize floor effects. Procedures similar to those used by the online panel companies were implemented, except that paper versions of the informed consent and assent forms were used by research staff. After informed consent was obtained from parents of children and assent was obtained from children aged 12 and older, parents completed the demographic and clinical information (clinical sample only) and children completed the Neuro-QoL items.

The pediatric cognitive function and fatigue items were subsequently tested with a pediatric English-speaking sample from the general population (PROsetta Stone wave 3). Again, we enlisted the services of an internet survey company (www.op4g.com) that maintains a panel of respondents from the general population to gain access to the panel members' children. We specified requirements for age, gender, race and ethnicity of the pediatric participants to approximate the 2010 US Census distributions. A randomly selected group of adult English-speaking panel members received an e-mail notifying them of a new survey opportunity for children. They were asked if they had a child ages 8 to 17. If they responded "yes", they were given information about the study and asked if they would give permission for their child to participate. Those parent / guardians who consented to have their child participate in the survey were then asked about the age of the child who would be participating, and to complete a set of sociodemographic, education and comorbidity items about that child. The parent /guardian was then asked to invite the child to the computer to complete the survey independently. The survey was administered only after the child also agreed to participate. A total of 507 pediatric respondents, ages 8 to 17, participated in the study.

Table 4 presents the nature of the pediatric calibration samples.

Table 4 – Calibration samples for pediatric items

| Sub-domain | Status | Calibration Sample |
|---|---------------|--|
| Depression | Item bank | Wave 1b (General Population) |
| Anxiety | Item bank | Wave 1b (General Population) |
| Anger | Item bank | Wave 1b (General Population) |
| Upper Extremity Function^a | Scale | <i>Not calibrated</i> |
| Lower Extremity Function^a | Scale | <i>Not calibrated</i> |
| Social Relations- Interaction with Peers^b | Item bank | Wave 1b (General Population) |
| Social Relations– Interaction with Adults | Item pool | <i>Not calibrated</i> |
| Fatigue | Item bank | PROsetta Stone w3 (General Population) |
| Pain | Item bank | Wave 1a + Wave 2 (muscular dystrophy and epilepsy) |
| Cognitive Function | Item bank | PROsetta Stone w3 (General Population) |
| Stigma | Item bank | Wave 1a + Wave 2 (muscular dystrophy and epilepsy) |

Note. ^a We chose not to calibrate *Upper extremity Function* and *Lower extremity Function* because of high skewness in the distributions of these constructs. ^b For *Sociability*, we identified two sub-domains, which were different from the original conceptualization: *interaction with peers* and *interaction with adults*. We did not calibrate the latter sub-domain because of poor model fit. Thus, we do not recommend creating a summary score from these items.

Sample sizes:

Note: Some participants were dropped from some IRT analyses due to missing data.

Wave 1a; Participants with epilepsy ($n = 50$) and muscular dystrophy ($n = 9$)

Wave 1b; $N = 513$ general population participants.

Wave 2; Participants with epilepsy ($n = 61$) and muscular dystrophy ($n = 51$)

PROsetta Stone w3; $N=507$ general population

Item Statistics

Item response theory: An overview. IRT is based on the notion that a person's response to a test item is a function of that person's location on a latent trait.¹⁰ The relationship between performance on an item and a latent trait is described by a mathematical function, which is known as an item characteristic curve. In IRT, the probability of responding to an item in a particular way (e.g., responding "1" for "Never" on a Neuro-QoL item) is a function of the person's level of the latent trait. For most IRT models, there are five parameters calculated per item: an item slope parameter and four threshold parameters. The number of threshold parameters is equal to the number of response options minus one. The item slope parameter indicates how well an item can discriminate between different levels of a construct. For that reason, it is sometimes known as a *discrimination parameter*.¹¹ The threshold parameter is related to a point on a continuum at which a person is more likely than not to endorse an item in a particular way. A threshold parameter is sometimes referred to as a *difficulty parameter* because in some analyses they are related to how difficult it is for the items to be endorsed in a particularly way. The predicted probability of responding to an item in a particular way is determined by a person's level on a latent trait, as well as the slope and threshold parameters. During our data-analytic phase, we used a process of iterative analysis and discussion with content domain experts; item-by-item level decisions were made as to whether an individual item should be: (1) calibrated and included in the bank, (2) not calibrated but retained for possible future calibration (e.g., items consistent with the domain being measured but having local dependence, responses concentrated in few of the available response options), or (3) excluded from further consideration (e.g. outside of concept; problematic item wording). All models were fit assuming unidimensionality, without local dependence between other items in the bank.

Item response theory models used in Neuro-QoL. Neuro-QoL psychometricians calibrated each item bank using IRT. *Calibration* refers to fitting the items into an IRT model such that its item slope and threshold parameters are estimated. The calibrated item parameters can then be used to underlie computer adaptive tests and inform the creation of short forms. The final Neuro-QoL item banks were calibrated using different IRT modeling depending on the sample size. For adults and pediatric generic domains, Samejima's (1997) graded response model was used. For pediatric targeted domains where sample size was less than 200, a 1-PL IRT model was used, in which a common slope parameter was estimated for all items. IRT analyses were conducted using MULTILOG or IRTPRO (adult Cognitive Function, Pediatric Cognitive Function and Pediatric Fatigue).

Before fitting IRT models, we examined datasets by examining descriptive statistics such as frequencies and means, as well as statistics based on classical psychometric analyses such as corrected item-total correlations. We also evaluated data quality by assessing an item's response distribution, including a search for out-of-range values. We tested IRT model assumptions (monotonicity, unidimensionality/local independence) and model fit (using $S-G^2$ & $S-X^2$) and made modifications to our models as needed.

Tables 3 and 4 present information about the calibration samples for adults and pediatrics, respectively. The tables in [APPENDIX A](#) present the calibrated Neuro-QoL item banks, as well as the list of items that were retained but not calibrated, and the items that were excluded altogether. Items were excluded based on psychometric analyses and the judgment of content experts. In addition to the calibrated item banks, there are additional sets of items grouped into item pools for bowel/bladder function, sexual function, end-of-life concerns, communication difficulty, and interaction with adults (pediatric). Items that met requirements of unidimensionality, but do not fit an IRT model, are treated as "scales" rather than calibrated item banks. The distinction is that whereas a scale can

be summed to obtain a total summary score, a calibrated bank can be administered using an array of different short forms, including CAT, to produce a summary score on the same, common metric. Examples of uncalibrated scales include pediatric upper extremity function and pediatric lower extremity function.

Assessment of unidimensionality. For each item pool, we strove to compile lists of items that measured a single construct consistent with the definition of content experts. We conducted formal tests of whether our item pools measured a single dimension. The challenge of dimensionality assessment is to develop approaches to assess whether a scale has a strong enough general factor so that it is essentially unidimensional. Essential dimensionality (e.g., McDonald, 1981) is defined as the degree to which a test score is influenced by a common factor underlying an item set. No complex item set will ever perfectly meet strictly defined unidimensionality assumptions (see McDonald, 1981); therefore, we sought to confirm that the trait level estimates are predominantly influenced by a general factor. Unidimensionality was examined for each item bank using confirmatory factor analysis guided by fit statistics as well as conceptual input from domain experts. As part of our confirmatory factor analyses, we also assessed *local dependence*, which refers to covariation between two or more items not accounted for by the unidimensional IRT model. Local dependence was assessed by examining the residual correlations between items.

Differential item functioning. An item displays differential item functioning (DIF) when the probabilities of responding in different categories differ by population for the same underlying level of the attribute. Items were evaluated for DIF by contrasting the IRT parameters across a variety of demographic groups. IRT-based hierarchical ordinal logistic regression (OLR) approach as implemented in LORDIF¹² was used for evaluation of DIF. In this approach a series of logistic models predicting the probability of item response were run and compared. The independent variables in Model 1 are the trait estimate (e.g., raw scale score), group and the interaction between group and trait. Model 2 included main effects of trait and group, and Model 3 included only the trait estimate. Non-uniform DIF was detected if there was a statistically significant difference in the likelihood for Model 1 and Model 2, and uniform DIF is evident if there is a significant difference in the likelihoods for Models 2 and 3. Items flagged for DIF were further discussed before making a final decision with regard to inclusion vs. exclusion based on how much impact DIF items had on final scales.

Neuro-QoL Field Testing and Clinical Validation

Our second phase of field testing was conducted from January 2009 through June 2010. The purpose was to evaluate the reliability, validity and responsiveness of Neuro-QoL short forms and scales in clinical neurology populations. A total of 581 adult and 113 pediatric patients were recruited to reflect the five adult and two pediatric neurological conditions targeted by Neuro-QoL. Proxies for stroke ($N = 84$) and the two pediatric samples ($N = 113$) also completed forms. Administration of Neuro-QoL Short Forms and clinical validation measures (both cross-disease and disease-specific), physician ratings and chart review was conducted at baseline and at a 180-day follow up (to assess responsiveness). Test-retest reliability of the Neuro-QoL Short Forms was evaluated at 7 days. Table 5 lists the number of patients with each respective neurological condition (and proxies) who completed each assessment.

Table 5 – Field Testing/Clinical Validation Sample

| | Number completing assessment | | |
|----------------------------|------------------------------|-------|---------|
| | Baseline | 7-day | 180-day |
| Multiple Sclerosis | 161 | 125 | 132 |
| Parkinson's disease | 120 | 116 | 108 |
| Adult Epilepsy | 119 | 119 | 109 |
| Stroke | 101 | 95 | 90 |
| Stroke Proxies | 84 | 78 | 73 |
| ALS | 80 | 77 | 59 |
| Pediatric Epilepsy | 62 | 60 | 56 |
| Pediatric Epilepsy Proxies | 62 | 60 | 56 |
| Muscular Dystrophy | 51 | 48 | 48 |
| Muscular Dystrophy Proxies | 51 | 48 | 48 |
| Total: | 891 | 826 | 779 |

Methods

Participating Sites. Participants were recruited from several clinical sites, including: Ann & Robert H. Lurie Children's Hospital of Chicago (formally, Children's Memorial Hospital of Chicago), Cleveland Clinic Foundation, Dartmouth-Hitchcock Medical Center, NorthShore University HealthSystem, Northwestern University Feinberg School of Medicine, Rehabilitation Institute of Chicago, University of California – Davis, University of Chicago, University of Puerto Rico, and University of Texas Health Science Center.

Site Procedures. Each accrual site had a coordinator who assumed overall responsibility for the project at that particular site. All procedures were approved by the NorthShore University HealthSystem Institutional Review Board (IRB) as well as IRBs at each respective institution. Site coordinators identified, enrolled and conducted assessments with eligible participants according to criteria and procedures specified in the Manual of Procedures. Because our goal was to produce a generalizable measurement platform, eligibility criteria were broad. Table 6 lists our general inclusion/exclusion criteria.

Table 6. Clinical Validation Sample Inclusion/Exclusion Criteria

| INCLUSION CRITERIA | | | | | | EXCLUSION CRITERIA |
|--------------------|-----------------|---|----------|--|---|--|
| Group | Age | Gender | Language | Diagnosed Neurological Condition | Proxy | |
| Children | Epilepsy: 10-18 | Proportional breakdown of males and females according to incidence rates of respective conditions | English | Epilepsy, Muscular Dystrophy | Proxies (primary care givers) of children with epilepsy or muscular dystrophy | <ul style="list-style-type: none"> • Younger/older than age limits • Non-English speaking • Cognitive impairment that would prevent informed consent and/or completion of test items with the assistance of an interviewer (as determined by recruiting staff). • Does not have a proxy (for adults with stroke or children with epilepsy or muscular dystrophy) |
| | MD: 10-21* | | | | | |
| Adults | >18 | | English | Stroke, MS, ALS, Parkinson's Disease, Epilepsy | Proxies of patients with stroke | |

*Due to the nature and developmental impact of muscular dystrophy, participants may be ≤21 years of age to meet eligibility requirements.

Additional, disease-specific exclusion criteria were: presence of non-epileptic seizures for epilepsy, and being non-community dwelling for stroke.

Recruitment and Testing. Various recruitment methods were utilized including: 1) approaching patients in clinics and 2) mailing letters of invitation to physician-identified patients informing them that someone would contact them about the study at their next clinic appointment. Informed consent or assent (for pediatric participants) was obtained from each subject and covered all three assessments (baseline, 7 days, and 180 days). There was a 5-9 day window for the test-retest assessment and a 5-7 month window for the responsiveness assessment. After a patient was identified and approached, the site coordinator arranged a meeting to introduce and describe the study, confirm eligibility, explain participants' rights, and obtain informed consent and HIPPA authorization if the eligible participant was interested. Site personnel then either administered the baseline evaluation at that time or else scheduled it for another time. Baseline evaluations, consisting of Neuro-QoL instruments, concurrent validity measures, and sociodemographic and clinical data forms, lasted approximately 90 minutes. Some measures, including the Neuro-QoL instruments, were self-reported via a computer. Other measures were administered by study staff (e.g., performance-based cognitive measures). Medical professional ratings and chart review were also conducted at baseline and as part of the 180-day follow up. Participants were reimbursed according to local IRB-approved standards.

Measures

General Forms

Socio-demographic form. This form provides patient characteristics (e.g., age, gender, race, ethnicity and education). This information was collected at baseline via chart review and/or face-to-face interview.

Clinical information form. This form records disease specific information (e.g., date of diagnosis, treatments) for each participant. It was gathered via chart review and through interviews with patients and/or parents at baseline and 180-day follow-up interviews.

Neuro-QoL Short Forms

All short forms provided raw scores which were converted to T-Scores; with a T = 50 indicating average function compared to the reference population and a standard deviation of 10. Neuro-QoL T-scores referenced to a general population sample are indicated by GPT (General Population T-Score) while those referenced to a clinical sample are indicated by CT (Clinical T-Score).

General Function – Adults Only

Barthel Index. The Barthel Index was developed by Mahoney and Barthel¹³ and is one of the best known and most widely used instruments to assess basic activities of daily living (ADL). The Barthel Index assesses the degree of independence a patient has in performing various self-care and mobility ADL tasks. The weighted ordinal scale assesses 10 items of ADL in the following subgroups: personal care (including eating), dressing, personal hygiene and bathing, continence of urine and stool, mobility (including transfer from a bed and toilet), walking, and steps. The index has high test-retest reliability ($r=0.89$), inter-rater reliability ($r>0.95$), (Granger, Albrecht, & Hamilton, 1979) and internal consistency (Cronbach's $\alpha = 0.98$). (Shinar et al., 1987) We administered this by standardized interview.

Instrumental Activities of Daily Living Scale. The Lawton Instrumental Activities of Daily Living Scale,¹⁴ is an interviewer administered measure which includes 8 items: telephoning, shopping, food preparation, housekeeping, laundry, transportation, medications, and handling finances. Each task is graduated in a 3- or 4-level scale. The scale measures performance in contrast to ability.

General Function – Adults and Children

Karnofsky Performance Status Scale (KPSS).¹⁵ The KPSS is a rating of functional impairment and offers a simple if coarse breakdown of activity level across patients regardless of diagnosis. KPSS criteria are based on descriptive categories from 0-100. Ratings were made by providers.

Cognitive Function – Adults and Children

Oral Digit Symbol Modalities.¹⁶ This is a test of speed of information processing, but is also thought to assess visual acuity and figural memory. A timed coding task using a key as reference, examinees pair specific numbers (0-9) with designated geometric figures that are matched up in the key; examinees attempt to complete as many matches as quickly as possible in 90 seconds. Written and oral forms are highly correlated (in normal adults $>.78$). Because some participants may have greater motor deficits compared to others, we administered the oral version.

Symbol Search.¹⁷ A test of mental speed, this is a timed orthographic measure of visual attention, scanning, and motor speed. Participants must determine if a target nonsense figure is present in a string of figures and mark a corresponding "yes" or "no" box presented at the end of each item.

Digit Symbol Coding.¹⁷ This is a timed paper/pencil symbol substitution task of mental, visual and motor speed. Using a key of paired numbers and symbols, participants must draw corresponding nonsense symbols below rows of numbers.

Health Related Quality of Life – Adults (including proxies) and Children

EQ-5D.^{18,19} This is a 15-item self-report measure of health status developed by the EuroQoL Group in order to provide a simple, generic measure of HRQL for clinical and economic appraisal. Applicable to a wide range of health conditions and treatments, it provides a simple descriptive profile and a single index value for health status. Domains include: mobility, self-care, usual activities, pain/discomfort and anxiety/depression.

PROMIS Global Health Scale.²⁰ Global health refers to evaluations of health in general rather than specific elements of health. The PROMIS global health items include global ratings of the five primary PROMIS domains (physical function, fatigue, pain, emotional distress, social health) and general health perceptions that cut across domains. It can be scored into a Global Physical Health component and Global Mental Health component. Global items allow respondents to weigh together different aspects of health to arrive at a ‘bottom-line’ indicator of their health status. Global health items have been found to be consistently predictive of important future events such as health care utilization and mortality.

Global HRQL Question.²¹ A single item from the Functional Assessment of Chronic Illness Therapy (FACIT), “I am content with the quality of my life right now,” was used as a global measure of quality of life.

Health Related Quality of Life – Children and Pediatric proxies

Pediatric Quality of Life Inventory, Multidimensional Fatigue Scale (PedsQL™-MFS)^{22,23} The PedsQL - MFS is a self-report measure consisting of both a general quality of life measure (PedsQL™) and a fatigue specific measure (MFS). The PedsQL™ is designed to measure core health dimensions in children from 2 to 18 years old. The measure consists of 23 items in four scales: physical functioning, emotional functioning, social functioning, and school functioning. Children/Teens completed a self-report assessment. Proxies completed the parent/caregiver form. The MFS consists of 18 items across three domains: general fatigue (6 items), sleep/rest fatigue (6 items), and cognitive fatigue (6 items).

Pain – Adults (including proxies) and Children

Pain question. A single (0-10) item that asks patients to rate, from “none” (0) to “the worst pain you can think of (“10”), the severity of their worst pain during the past week.

Responsiveness – Adults and Children

Karnofsky Performance Status Scale (KPSS).¹⁵ Described above.

Global rating of change. This measurement strategy assumes that a patient can judge whether over the course of a specified period, their self-reported health status has changed. Typically, such questions require patients to remember a prior health state and compare it to how they are currently feeling.^{24,25} In this study, participants were asked to rate how much their Physical, Emotional, Cognitive, Social/Family and Symptomatic Well-being and their overall quality of life had changed over the past 6 months according to the following scale: +3 = “Very much better” to -3 = “Very much worse”. Such global transition ratings have the advantage of being easy to interpret and they enhance the interpretability of HRQL scores when found to be correlated with the target instrument. For instance, if the correlation between a global rating of change and the change score on a target instrument is over 0.5, the validity of the target instrument is supported. Global transition ratings have been widely used in HRQL outcome assessments to augment the interpretation of HRQL scores.²⁶⁻²⁸ Proxies completed a proxy version of this measure.

Statistical Analyses

The following analyses were conducted for all clinical groups.

1. Means, standard deviations, and other distributional statistics were calculated for all scores at the baseline and follow-up assessments.
2. Internal consistency reliability - Internal consistency analyses were performed for each Neuro QoL measure using Cronbach's alpha coefficients.
3. Test-retest reliability - Intraclass correlation coefficients and corresponding 95% confidence intervals were calculated to assess the test-retest reliability of the Neuro-QoL measures using the baseline and 7-day assessments.
4. Concurrent validity was assessed at baseline by Spearman rho correlations between Neuro-QoL short forms and disease-specific and cross-disease measures.
5. Known groups validity was evaluated at baseline by comparing mean Neuro-QoL scores between patients grouped by clinical anchors such as disease severity. Analysis of variance (ANOVA) was used to test for differences between groups. Effect sizes (mean difference / pooled standard deviation) were calculated to aid in interpretation of group differences.
6. Responsiveness -To demonstrate the sensitivity of the Neuro-QoL measures for detection of change, we evaluated general linear models using each patient's change score. We conducted responsiveness analyses on the Neuro-QoL banks using several criteria for change. One criterion used across all adult conditions was the Karnofsky Performance Status, and another was the self-reported Global Rating of Change (GRC) described above. Here we report the results from the GRC-based change. Beginning with the 7-level GRC (range: 1= very much better; 4 = about the same; 7 = very much worse), we collapsed the three "better" categories into one, and the three "worse" categories into one, leaving three categories ("better;" "about the same;" "worse"). These three categories were compared using one-way analysis of variance followed by least significant difference testing of adjacent groups when the overall F statistic was significant. For each analysis, we required that at least 10 patients be represented in each of these three categories. If fewer than ten patients were represented in a category, it was collapsed with the adjacent category and the two remaining groups were compared using a t-test. There were six GRC questions. Five of them queried patients specifically about change in Physical well-being, Cognitive Well-Being, Emotional well-being, Social/Family Well-being, and Disease-related Symptoms. The sixth GRC item asked about overall quality of life. The list below indicates which of the 13 adult item bank change scores were compared across GRC categories:

| | |
|-----------------------|---|
| Physical well-being: | Upper Extremity and Lower Extremity Function; Fatigue; Sleep Disturbance |
| Cognitive well-being: | Cognitive Function |
| Emotional well-being: | Depression; Anxiety; Stigma; Positive Affect and Well-Being; Emotional and Behavioral Dyscontrol |
| Social well-being: | Social Function (Ability to Participate in Social Roles and Activities and Satisfaction with Social Roles and Activities); Stigma |
| Symptoms: | Fatigue; Sleep Disturbance; Emotional and Behavioral Dyscontrol; Depression; Anxiety |
| Overall: | ALL |

This resulted in 31 planned comparisons for adult clinical validation sample (no adjustment made for multiple comparisons). Results for these responsiveness analyses are presented below. Only those that achieved statistical significance will be summarized.

Disease-specific Measures and Results

Stroke

Disease-Specific Measures

Stroke Specific Quality of Life (SS-QOL) scale. (Williams, Weinberger, Harris, Clark, & Biller, 1999) The SSQOL is a 49 item self-report measure containing domains of energy, family roles, language, mobility, mood, personality, self-care, social roles, thinking, vision, upper extremity function and work-productivity. Items are scored on a 5-point Likert scale. Although relatively new, initial psychometric properties are good.

The American Heart Association Stroke Outcome Classification (AHA.SOC). ^{29,30}The AHA.SOC score provides a mechanism to comprehensively document stroke impairments and disabilities in a single summary stroke score. The system can be used by healthcare providers to reliably assess recovery, measure responses to treatment, and describe the long-term impact of stroke on survivors.

Results

Sample characteristics. 101 subjects were recruited from 5 centers. Participants were primarily male (55%), white (73%), and non-Hispanic (90%) with average age=59 years (SD=14). Fifty-seven percent were married, 73% had a high school or greater education. Thirteen percent were retired, 33% on disability and 19% were employed either full or part time. Average time post-stroke was 5.4 years (SD=5), with 22% reporting no or minimal deficits, 58% mild/moderate deficits and 20% severe deficits. The primary stroke type was an infarction (71%).

As shown in Table 7, respondents reported worse cognitive and physical function and social well-being than the general population reference group, but more positive affect and well-being. When compared to a clinical reference group, they reported less depression, fatigue and sleep disturbance, better emotional and behavior control and average stigma.

Reliability: Table 7 shows that the internal consistency and 1 week test-retest reliability of the short forms is high, with Cronbach's alphas ranging from .78 to .94 and ICCs ranging from .57 to .89.

Table 7. Descriptive and reliability statistics for Neuro-QoL short form T-scores

| Neuro-QoL Short Form | N_{items} | $N_{persons}$ | M_{GPT} | M_{CT} | SD | α | T-R ICCs** |

*p < .05; **p < .01; ***p < .001

Known groups validity: AHA severity level was used to split the sample into 3 groups: no/minimal neurological deficit; mild/moderate neurological deficit; severe neurological deficit. These groups differed significantly on all Neuro-QoL short forms except Anxiety, Fatigue, Sleep Disturbance and Emotional and Behavioral Dyscontrol. Effect sizes ranged from -.68 to 2.55.

Responsiveness: Of the 31 planned comparisons, 15 were statistically significant and one exhibited a trend toward significance, in the predicted direction.

Physical Well-Being: Of the four planned comparisons [Lower Extremity Function-Mobility, Upper Extremity Function - Fine Motor, ADL, Fatigue, and Sleep Disturbance] three were statistically significant, all in the predicted direction. Specifically, significant differences were observed in Lower Extremity Function – Mobility between patients who reported worsening at six months with those who reported improving in this domain, and those that stayed the same ($F=6.11$, $p<.01$). Similarly, significant differences were observed in Upper Extremity Function - Fine Motor, ADL ($F=6.83$, $p<.01$) and Sleep Disturbance ($F=4.08$, $p<.05$) between patients who reported worsening at six months, those who reported staying the same, and those that improved in this domain.

Social/Family Well-Being: Of the three planned comparisons [Ability to Participate in Social Roles and Activities, Satisfaction with Social Roles and Activities, Stigma] all three were statistically significant in the predicted direction. Specifically, significant differences were observed in Ability to Participate in Social Roles and Activities ($F=3.76$, $p<.05$) and Stigma ($F=5.55$, $p<.01$) between each of the three change groups (improved, no change, declined). Similarly, significant differences were observed in Satisfaction with Social Roles and Activities ($F=5.86$, $p<.01$) between patients who reported worsening at six months, those who reported staying the same, and those that improved in this domain.

Emotional Well-Being: Of the five planned comparisons [Depression, Anxiety, Emotional and Behavioral Dyscontrol, Stigma, Positive Affect and Well-being] four were statistically significant, all in the predicted direction. Specifically, statistically significant differences were observed between patients who reported worse Anxiety at six months with those who reported the same levels, and those that reported less anxiety in this domain ($F=3.42$; $p<.05$). Similarly, significant differences were observed in Depression ($F=13.53$, $p<.01$), Stigma ($F=7.40$, $p<.01$) and Positive Affect and Well-being ($F=6.35$, $p<.01$) between patients who reported worsening at six months, those who reported staying the same, and those that improved in this domain.

Cognitive Well-Being: One planned comparison [Cognitive Function] was not significant and did not trend toward significance. T-tests were used to examine differences between those that reported improved cognitive function compared to those that reported diminished cognitive function or no change. These groupings were used due to a small sample size ($n=7$) in the group reporting decline in cognitive function.

Symptomatic Well-Being: Of the five planned comparisons [Fatigue, Sleep Disturbance, Emotional and Behavioral Dyscontrol, Depression, Anxiety] one was statistically significant in the predicted direction. Specifically, differences were observed in Sleep Disturbance at six months between patients who reported worsening, staying the same and improving in this domain ($F=3.49$; $p<.05$).

Overall Quality of Life: Of the thirteen planned comparisons [all Neuro-QoL short forms] one exhibited a trend toward significance, and four were statistically significant, all in the predicted direction. Specifically, a trend toward statistical significance was observed between patients who reported change in Positive Affect and Well-being and those that reported change in overall quality of life ($F=2.98$, $p=.06$). In addition, statistically significant differences were observed between patients who reported worse Sleep Disturbance ($F=5.45$, $p<.01$), Depression ($F=8.28$, $p<.01$), Stigma ($F=4.75$, $p<.05$), and Lower Extremity Function – Mobility ($F=4.02$, $p<.05$) at six months with those who reported staying the same or improving in these domains.

Conclusions

- The validity of the Neuro-QoL measures for adults with stroke is supported with satisfactory internal consistency, test-retest reliability and significant correlations with many external validity measures.
- All Neuro-QoL short forms except Cognitive Function were responsive to self-reported change in conceptually-related aspects of well-being.

Amyotrophic Lateral Sclerosis (ALS)

Disease-specific measures

Amyotrophic Lateral Sclerosis Assessment Scale (ALSAQ³¹⁻³³) The ALSAQ is comprised of 40 items across 5 subscales tapping the major domains affected by ALS. The subscales include physical mobility, activities of daily living, eating and drinking, communication and emotional functioning. All 40 items can also be summed together to obtain a total score for ALS QOL. Recently, the scale authors published data on the score differences that might be considered to meaningfully differentiate between subgroups or within groups of subjects over time.³⁴ This makes the ALSAQ particularly valuable for evaluating the convergent validity and responsiveness of the Neuro-QoL item banks.

Amyotrophic Lateral Sclerosis Functional Rating Scale-Revised (ALSFERS-R³⁵). The original scale, the ALSFRS, has 10 items that assess activities of daily living, such as speech, swallowing, handwriting, and dressing and hygiene that are specifically affected by the disease. In 1999, three additional items were added to better assess respiratory function. Both the original and revised versions have been used successfully as clinical trial outcome measures.³⁶ Because of the importance of respiratory problems in the ALS population, we administered the 12-item ALSFRS-R.

Results

Sample characteristics: Participants (N=80) were primarily male (65%), white (94%), and non-Hispanic (98%) with average age=59 years (SD=12.3). Seventy-six percent were married, 46% had a college or advanced degree. Thirty-six percent were retired, 38% on disability, 17% were employed full- and 8% were employed part time. Average time since diagnosis was 2.0 years (SD=3.6). The mean ALSFRS-R score = 32.0 (SD=8.6) with range = 8-48.

Mean T-Scores and standard deviations on the short forms are shown in Table 10. ALS patients reported significantly worse physical and social function compared to a general population reference group but similar cognitive function and more positive affect. When compared to a clinical neurological reference group, they showed greater stigma, less sleep disturbance, fatigue, depression, and emotional and behavioral dyscontrol and similar anxiety.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 10. Cronbach's alphas range from .79 to .96 and ICCs from .48 to .92.

*p < .05; **p < .01; ***p < .001

Known groups validity: In the baseline assessment, the extent to which ALS patients agreed with the statement "I am content with my quality of life right now" was significantly associated with the following Neuro-QoL short forms: Depression, Anxiety, Positive psychological functioning, Social role - participation, Social role - satisfaction, and Fatigue. The corresponding effect sizes ranged from .22 to 2.86.

Responsiveness: Of the 31 planned comparisons, 4 were statistically significant and 1 exhibited a trend toward significance, all in the predicted direction.

Physical Well-being: Of the four planned comparisons, one was significant. Specifically, patients who reported a worsening of their physical well-being showed significantly worse Upper Extremity Function scores than those who reported no change ($t=-2.17$; $p<.05$).

Social/Family Well-being: Of the three planned comparisons, one was significant. Specifically, patients who reported decreased social/family well-being showed a greater decline in satisfaction with social roles and activities than those who reported no change or improvement in social/family well-being ($t=-2.29$; $p<.05$). .

Emotional Well-being: Of the five planned comparisons, one was significant. Patients who reported decreasing emotional well-being showed increased scores on the Depression Short Form ($F=3.30$; $p<.05$).

Cognitive Well-being: The number of participants reporting change in cognitive well-being was not conducive to responsiveness analysis using ANOVA or T-test. 5 participants reported decline in cognitive well-being, and 3 reported increased well-being, thus categories could not be collapsed to create 2 categories with n of at least 10 participants.

Symptomatic Well-being: Of the five planned comparisons, none were significant.

Overall Quality of Life: Of the thirteen planned comparisons, one was significant and one approached significance. Specifically, patients who reported a decrease in overall quality of life also showed significant worsening of upper extremity function ($t=-3.17$; $p<.01$) and a trend toward increasing fatigue ($t=-1.68$; $p<.10$).

Conclusions:

- The study sample represented a wide range of functioning, similar to an ALS clinic population
- Internal consistency was high for 11, and adequate for 2, of the 13 Neuro-QoL scales
- The Intraclass Correlation Coefficients (ICC) ranged from .48 (ability to participate in social roles and activities) to .92 (upper extremity), suggesting that further evaluation of test-retest reliability is warranted in some cases.
- Convergent and discriminant validity appear to be excellent, with correlations of the expected strength and in the expected direction
- Several Neuro-QoL short forms (Upper Extremity Function, Cognitive Function, and Depression) demonstrated responsiveness to self-reported change. The remaining short forms did not.

Multiple Sclerosis (MS)

Disease-Specific Measures

Functional Assessment of Multiple Sclerosis (FAMS). The FAMS was developed by Cella and Aaronson and includes 44 questions, divided into six subscales: mobility, symptoms, emotional well-being (depression), general contentment, thinking/fatigue, and family/social well-being. Fifteen un-scored questions are included because of their clinical value.

Multiple Sclerosis Functional Composite Measure (MSFC). The MSFC was developed as an outcome measure by the National MS Society's Clinical Outcomes Assessment Task Force to address the poor reliability and sensitivity of available MS rating scales.³⁷ The MSFC consists of three objective quantitative tests of neurological functioning: arm, leg and cognitive function. Arm function is assessed with the nine-hole peg test; leg function with the timed 25-foot walk, and cognitive function with the Paced Auditory Serial Addition Test (PASAT) (being substituted with Oral Symbol Digit test for this study). The MSFC correlates with MRI parameters,³⁸⁻⁴⁰ measures of disability,⁴¹⁻⁴³ and has predictive validity.^{42,44,45} MSFC scores are sensitive to change.^{37,46} It demonstrates excellent intra-rater (ICC =.97) and inter-rater (ICC =0.95 - 0.96) reliability^{42,47} for technicians trained with standardized procedures. Scores on the three MSFC components are transformed into Z scores, and then combined into a total MSFC Z score, providing a continuous scale of measurement.

The MS Performance Scales is a medical professional reported measure of MS-related disability. The Performance Scales measure disability in eight domains of function: mobility, hand function, vision, fatigue, cognition, bladder/bowel, sensory, and spasticity. The construct and criterion validity of the subscales of the Performance Scales has been established.⁴⁸

Results

Sample characteristics. Participants (N=161) were primarily female (86%), white (88%), and non-Hispanic (93%) with average age=49.8 years (SD=10.5). 58.4% were married, 90% had some college or a college degree. Thirty-seven percent were on disability and 34% were employed full time. MSFC scores ranged from -2.90 to 1.7, with mean=0.0 (SD=.69). Mean MS Performance Scale score = 16.04 (SD=9.18; range = 0-35).

Mean T-Scores and standard deviations on the short forms are shown in Table 13. MS patients reported worse physical, social and cognitive function compared to a general population reference group but greater positive affect. When compared to a clinical neurological reference group, they showed less depression and better emotional and behavioral control but similar levels of stigma, sleep disturbance, fatigue and anxiety.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 13. Cronbach's alphas range from .81 to .95 and ICCs from .72 to .91.

*p = .05; **p = .01; ***p = .001

Known groups validity: Patients grouped according to MSFC quartile scored significantly differently on all Neuro-QoL SFs, except Anxiety, Depression, and Emotional & Behavioral Dyscontrol, with effect sizes ranging from .47 to 2.15.

Responsiveness: Of the 31 planned comparisons, 18 were statistically significant and 3 exhibited a trend toward significance, in the predicted direction.

Physical Well-being: Of the four planned comparisons, one was significant and one exhibited a trend toward significance, both in the predicted direction. Specifically, patients who reported a worsening of their physical well-being showed worsening of scores on Physical Function – Lower Extremity (extended assessment; $F=4.36$; $p<.05$) and a trend toward worse fatigue ($F=2.36$; $p<.10$).

Social/Family Well-being: Of the three planned comparisons, one was significant. Specifically, patients who reported improved social/family well-being at 6 months also reported decreasing stigma ($F=3.98$, $p<.05$).

Emotional Well-being: Of the five planned comparisons, all were significant. Patients who reported worsening emotional well-being also reported increased depression ($F=14.82$; $p<.0001$), anxiety ($F=7.28$; $p<.01$), stigma ($F=3.36$; $p<.05$) and emotional and behavioral dyscontrol ($F=3.19$; $p<.05$) and decreased positive affect and well-being.

Cognitive Well-being: The one planned comparison was significant and in the predicted direction. Patients who reported worsening cognitive well-being showed worsening cognitive function ($F=8.54$; $p<.001$).

Symptomatic Well-being: Of the five planned comparisons, three were significant. Patients who reported worsened symptomatic well-being showed worsening on the Depression Short Form ($F=5.02$; $p<.01$). Patients who reported improved symptomatic well-being showed decreased fatigue ($F=6.45$; $p<.01$) and improved emotional and behavioral control ($F=3.14$; $p<.05$).

Overall Quality of Life: Of the twelve planned comparisons, seven were significant and one showed a trend toward significance. Patients who reported decreased overall quality of life also showed worsening depression ($F=8.99$; $p<.001$), anxiety ($F=5.57$; $p<.05$), stigma ($F=4.05$; $p<.05$), positive affect ($F=13.10$; $p<.00001$) ability to participate in social roles and activities ($F=3.91$; $p<.05$), fatigue ($F=3.12$; $p<.05$), emotional and behavioral dyscontrol ($F=3.39$; $p<.05$) and a trend toward decreased upper extremity function ($F=2.51$; $p<.10$).

Conclusions

- The study sample was generally representative of MS clinic populations
- The 12 Neuro-QoL scales demonstrated high internal consistency
- The Intraclass Correlation Coefficients (ICC) were acceptable, ranging from .72 (depression) to .91 (lower extremity)
- Convergent validity with generic and legacy measures was good; correlations were of the expected strength and direction and short forms discriminated between patients grouped according to disease severity.
- There is some initial evidence for Neuro-QoL short form responsiveness to self-reported change in MS patients, particularly for the short forms assessing emotional and cognitive well-being, where all planned comparisons were significant.

Parkinson's Disease

Disease-specific measures

Montreal Cognitive Assessment (MoCA).⁴⁹ Designed as a rapid screening instrument for mild cognitive dysfunction, it assesses different cognitive domains: attention and concentration, executive functions, memory, language, visuoconstructional skills, conceptual thinking, calculations, and orientation. Scores range from 0-31, with scores below 26 considered abnormal.

Parkinson's disease Questionnaire-39 (PDQ-39).^{50,51} The thirty nine items of this self-report measure assess eight dimensions: mobility, activities of daily living, emotional well-being, bodily discomfort, stigma, social support cognition and communication. Scale and summary scores are available, ranging from 0-100, with higher scores indicating greater problems.

Unified Parkinson's Disease Rating Scale (UPDRS).⁵² The UPDRS is the most widely used measure of disability and impairment associated with PD. It is a composite scale consisting of 4 parts: Mentation, Behavior and Mood (UPDRS mental score); ADLs (UPDRS ADL score), Motor Function (motor score); and Complications of therapy. The first 3 subscales are quantitative five point scales (0-4). The complications of therapy is a yes/no scale. For this study, UPDRS Motor Function scoring was modified as follows: only the most affected side or body part was rated. All ratings were made by physicians or other medical personnel.

Hoehn and Yahr staging.⁵³ The Hoehn and Yahr staging consists of 5 disease severity categories ranging from 0.0 (no signs of disease) to 5.0 (wheelchair bound or bedridden unless aided). The staging was obtained through chart review or through direct contact with the patient's physician or other medical personnel.

Patient Health Questionnaire-9 (PHQ-9).⁵⁴ This is a 9-item subset of the PHQ, and assesses self-reported depression. The nine items of the PHQ-9 come directly from the nine DSM-IV signs and symptoms of major depression.

Results

Sample characteristics: Participants were primarily male (62%), white (95%), and non-Hispanic (97%) with average age=65. Seventy-four percent were married, 55% had a college or advanced degree. Fifty-eight percent were retired and 20% were employed either full or part time. Most (76%) were in mild stages of the disease: Hoehn and Yahr 1 (N=19; 16%), 2 (N=72; 60%), 3 (N=23; 19%), 4 (N=6; 5%). Average time since PD diagnosis was 7.1 years. 80% were taking L-Dopa either alone or in combination with other anti-PD medications and 9% reported undergoing prior PD surgery. A majority of patients (55%) were primarily affected on their right side; most experienced no (43%) or little (33%) activity limitation due to motor fluctuations.

Mean T-Scores and standard deviations on the Neuro-QoL short forms are shown in Table 16. PD patients reported worse cognitive, physical and social function compared to a general population reference group but more positive affect and well-being. When compared to a clinical neurological population, they showed less sleep disturbance, fatigue and depression and a greater sense of emotional and behavioral control.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 16. Cronbach's alphas range from .81 to .94 and ICCs from .6880 to .80.

*p ≤ .05; **p ≤ .01; ***p ≤ .001

Known groups validity: Patients in H & Y Stage 1 or 2 scored significantly differently on all Neuro-QoL SFs, except Cognitive Function and Emotional & Behavioral Dyscontrol, than did patients in Stages 3 or 4, with effect sizes ranging from .5 to 1.11.

Responsiveness: Of the 31 planned comparisons, 7 were statistically significant and 1 exhibited a trend toward significance, in the predicted direction.

Physical Well-being: Of the four planned comparisons, two were significant in the predicted direction. Specifically, patients who reported a worsening of their physical well-being showed worsening of scores on Fatigue (F=8.13; $p<.01$) and Lower Extremity Function (extended assessment; F=4.69; $p<.05$).

Cognitive Well-being: The one planned comparison was not significant.

Emotional Well-being: Of the five planned comparisons, one showed a trend toward significance. Patients who reported changes in emotional well-being also exhibited a trend toward having changes in positive affect and well-being (F=2.58; $p<.10$).

Social/Family Well-being: Of the three planned comparisons, none were significant.

Symptomatic Well-being: Of the five planned comparisons, one was significant. Specifically, patients who reported worsening symptomatic well-being also demonstrated worsening scores on Fatigue (extended assessment; F=3.32; $p<.05$).

Overall Quality of Life: Of the thirteen planned comparisons, four were significant. Patients who reported a worsening of overall quality of life showed decreasing positive affect and well-being (F=6.73; $p<.01$), ability to participate in social activities (F=4.04; $p<.05$), and upper extremity function (extended assessment, F=5.33; $p<.01$) and increasing fatigue (extended assessment, F=3.63; $p<.05$).

Conclusions:

- The Neuro-QoL measures demonstrated high internal consistency.
- Test-retest reliability was acceptable, but lower than expected for Depression and Satisfaction with Social Roles and Activities.
- Convergent validity was supported by correlations with generic and PD-specific measures in the expected directions. Correlations were generally modest in strength, warranting additional validation in PD samples. Neuro-QoL measures showed good discrimination between patients at different levels of disease severity.
- There was only limited evidence for responsiveness to self-reported changes in different domains of well-being.

Adult Epilepsy

Disease-Specific Measures

Quality of Life in Epilepsy-31(QOLIE-31).^{55,56} The QOLIE-31 is an HRQL survey for adults (>18) with epilepsy. Derived from the QOLIE-89, this scale contains domains that include seizure worry, emotional wellbeing, energy/fatigue, cognition, medication effects, social effects, health status and overall quality of life. Good psychometric evidence has been reported in previous studies.

Liverpool Seizure Severity Scale (LSSS). The LSSS is a 12 item scale that assesses experiences during and immediately after a seizure such as loss of consciousness and post-ictal confusion. Each item is scored on a Likert scale, with higher scores indicating greater seizure severity. Reported test retest reliabilities range from 0.74 – 0.80.^{57,58} A modified scoring system requires patients to rate only their most severe seizure and demonstrates adequate reliability, construct validity and responsiveness to change.⁵⁹

Liverpool Adverse Events Profile (LAEP).⁶⁰ The LAEP is a 19 item self-report scale that assesses the frequency of antiepileptic drug side effects. Using a 4-point Likert scale (1= never a Problem – 4=always a problem), scores are summed to create a total score (ranging from 19-76, higher scores indicating more symptoms).

Results

Sample characteristics. Participants were primarily male (51%), white (85%), and non-Hispanic (75%) with average age=47.3 (Range = 18-93). Forty-seven percent were married, 67% had some college or beyond. Fourteen percent were retired, 22% on disability and 37% were employed either full or part time. Average time since epilepsy diagnosis was 18.5 years (SD=13.9). Generalized seizures were most frequently experienced (57%) followed by focal seizures (25%). Mean number of seizures in the past 3 months = 10.7 (SD=37.6). 95% were taking medication for their seizure disorder, with 64% of those on polytherapy. Twelve percent had undergone surgery for their epilepsy.

Mean T-Scores and standard deviations on the short forms are shown in Table 19. Epilepsy patients reported significantly worse cognitive and social function compared to a general population reference group but similar levels of physical function and greater positive affect and well-being. When compared to a clinical neurological population, they showed similar levels of stigma, greater anxiety, but less depression, sleep disturbance, fatigue, and sense of emotional and behavioral dyscontrol.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 19. Cronbach's alphas range from .86 to .95 and ICCs from .40 to .80.

* =p< .05; ** = p< 0.01

Known groups validity: Statistically significant known group differences were observed between Leeds Seizure Severity Scale quartile groups and the following Neuro-QoL short forms: Anxiety ($F=5.15$, $p<.01$), Depression ($F=5.71$, $p<.01$), Emotional and Behavioral Dyscontrol ($F=4.32$, $p<.01$), Fatigue ($F=9.08$, $p<.01$), Positive Affect and Well-being ($F=6.3$, $p<.01$), Sleep Disturbance ($F=3.36$, $p<.01$), Stigma ($F=4.65$, $p<.01$) and Upper Extremity - Fine Motor, ADL ($F=4.07$, $p<.01$).

Responsiveness: Of the 31 planned comparisons, seven were statistically significant and eight exhibited a trend toward significance, in the predicted direction.

Physical Well-Being: Of the four planned comparisons [Lower Extremity Function-Mobility, Upper Extremity Function - Fine Motor, ADL, Fatigue, and Sleep Disturbance] two were statistically significant and one exhibited a trend toward significance, all in the predicted direction. Specifically, a trend toward significance was observed between patients who reported worse Physical Function – Lower Extremity at six months with those who reported better functioning ($F=2.74$; $p=.069$). Statistically significant differences were observed between patients who reported worsening at six months with those who reported staying the same or improving in both Fatigue ($F=5.11$; $p<.01$) and Sleep Disturbance ($F=3.47$, $p<.05$).

Social/Family Well-Being. Of the three planned comparisons [Ability to Participate in Social Roles and Activities, Satisfaction with Social Roles and Activities, Stigma] one exhibited a trend toward significance, in the predicted direction. Specifically, a trend toward significance was observed between patients who reported worse Ability to Participate in Social Roles and Activities at six months with those who reported improvements in this domain ($F=2.56$; $p=.082$).

Emotional Well-Being. Of the five planned comparisons [Depression, Anxiety, Emotional and Behavioral Dyscontrol, Stigma, Positive Affect and Well-being] two were statistically significant and two exhibited a trend toward significance, all in the predicted direction. Specifically, a trend toward significance was observed between patients who reported worse Anxiety ($F=2.62$; $p=.077$) and Emotional Behavioral Dyscontrol ($F=3.05$; $p=.051$) at six months with those who reported improvements in this domain. Statistically significant differences were observed between patients who reported change in Depression at six months with those who reported change in this domain ($F=4.82$; $p<.01$) and between patients who reported change in Positive Affect and Well-being with those who reported change in this domain ($F=7.21$, $p<.01$).

Cognitive Well-Being. The one planned comparison was not significant.

Symptomatic Well-Being. Of the five planned comparisons [Fatigue, Sleep Disturbance, Emotional and Behavioral Dyscontrol, Depression, Anxiety] one was statistically significant in the predicted direction, and one exhibited a trend toward significance. Differences were observed between patients who reported change in Depression at six months with those who reported change in this domain ($F=4.01$; $p<.05$). Differences between those who reported change in fatigue as well as change in this domain trended toward significance ($F=2.37$; $p=.099$).

Overall Quality of Life. Of the twelve planned comparisons [all Neuro-QoL short forms] two were statistically significant and four exhibited a trend toward significance, all in the predicted direction. A trend toward significance was observed between patients who reported change in their scores of Emotional and Behavioral Dyscontrol ($F=2.90$, $p=.060$), Anxiety ($F=2.85$, $p=.062$), Fatigue ($F=2.71$, $p=.071$), and Ability to Participate in Social Roles and Activities ($F=2.70$, $p=.072$). Statistically significant differences were observed between patients who reported change in Depression over time with those who reported change in this domain ($F=3.62$; $p<.05$). Significant differences were also observed between patients who reported change in Positive Affect and Well-being at six months compared to those who reported change in this domain ($F=6.19$, $p<.01$).

Conclusions:

- The 12 Neuro-QoL scales demonstrated high internal consistency, ranging from .86 (Sleep disturbance) to .95 (Depression)
- The Intraclass Correlation Coefficients (ICC) were generally acceptable, ranging from .40 (Ability to Participate in Social Roles and Activities) to .80 (Lower Extremity Function – Mobility)
- Convergent and discriminant validity were good, with correlations of the expected strength and in the expected direction. Neuro-QoL measures discriminated between patients at different levels of disease severity.
- There is initial evidence of responsiveness. Self-reported changes in physical, emotional and symptomatic well-being and overall quality of life were reflected in significant changes in conceptually-related Neuro-QoL short forms.

Pediatric Epilepsy

Sample characteristics. Participants (N=61) were primarily male (62.3%), white (75.9%), and non-Hispanic (75.4%) with average age=13.4 (SD=2.6; range = 10 to 18). At baseline, 17.8% reported having seizures daily, 13.3% weekly, 35.6% monthly and 33.3% yearly, and all patients were taking anti-epilepsy drugs at the time of testing.

Mean T-Scores and standard deviations on the short forms are shown in Table 22. Pediatric epilepsy patients reported better function/less symptoms on all domains compared to the reference group.

Reliability: Internal consistency and 1 week test-retest reliability of the self-report short forms is shown in Table 22. Cronbach's alphas range from .44 to .86 and ICCs from .26 to .94.

Known groups validity: Patients with different seizure frequency (daily, weekly, monthly and yearly) scored significantly differently on Cognitive Function ($F=3.84$; $p=0.016$). The same groupings of seizure frequency yielded results approaching significance for the anxiety ($F=2.57$; $p=0.068$) and fatigue measures ($F=2.56$; $p=0.068$).

Responsiveness: Similar to adult patients, we conducted responsiveness analyses on the Neuro-QoL banks using the Karnofsky Performance Status and the self-reported Global Rating of Change (GRC). Here we report the results from the GRC-based change. Beginning with the 7-level GRC (range: +3= very much better; 0 = about the same; -3 = very much worse), we collapsed the three “better” categories into one, and the three “worse” categories into one, leaving three categories (“better,” “about the same,” “worse”). These three categories were compared using one way analysis of variance followed by least significant difference testing of adjacent groups when the overall F statistic was significant. For each analysis, we required that at least 10 patients be represented in each of these three categories. If fewer than ten patients were represented in a category, it was collapsed with the adjacent category and the two remaining groups were compared using a t-test. For pediatric epilepsy, less than 10 patients reported decline in well-being for each GRC question, thus t-tests were used to compare those that declined or reported no change to those that improved. There were six GRC questions. Five of them queried patients specifically about change in Physical well-being, Cognitive well-being, Emotional well-being, Social/Family well-being, and Symptomatic Well-being (Disease-related Symptoms). The sixth GRC item asked about overall quality of life.

The following indicates which of the 9 pediatric item bank change scores were compared across GRC categories:

| | |
|-----------------------|--|
| Physical well-being | Physical Function (Upper extremity and Lower extremity); Fatigue; Pain |
| Cognitive well-being: | Cognitive Function |
| Emotional well-being: | Depression; Anxiety; Stigma; |
| Social well-being: | Social Relation- Interaction with peers; Stigma |
| Symptoms: | Fatigue; Depression; Anxiety; Pain |
| Overall: | ALL |

This resulted in 23 planned comparisons for each wave two clinical validation sample (no adjustment made for multiple comparisons).

Of the 23 planned comparisons, none were statistically significant.

Conclusions:

- The current sample was generally high functioning.
- The 9 Neuro-QoL measures demonstrated high internal consistency. The Intraclass Correlation Coefficients (ICC) were acceptable, ranging from .26 (Pain) to .94 (Upper Extremity Function- Fine motor, ADL)
- Convergent validity associations with generic and legacy measures were of the expected strength and direction
- Responsiveness was not as good as we expected. It is hypothesized that this was due to the high functioning samples recruited in the testing with only a few patients reporting that they were getting worse at the 6-month follow-up. To test this hypothesis, we evaluated the responsiveness of the pedsQL generic (Emotional Functioning, Physical Functioning, Psychosocial Functioning, School Functioning, and Social Functioning). Among 30 possible comparisons, only two significant comparisons were identified: Psychosocial and Social Functioning for Global Rating of Change of the Symptom Well-Being. We therefore concluded that this sample had stable conditions over the study period and thus no significant responsiveness was detected in these analyses.

Muscular Dystrophies

Sample characteristics. Patients (N=51) were primarily male (84.3%), white (58.8%), and non-Hispanic (62.7%) with average age=16.3 (SD=3.4; range=10.1 to 21.9). Seventy-seven percent were full time students, 2% were in school part time, and 4% were employed part-time. Of them, 5.9% (n=3) reported falling daily, 9.8% (n=5) weekly, 9.8% (n=5) monthly, 19.6% (n=10) rarely fall, yet 54.9% (n=28) were unable to ambulate without a wheelchair. One patient reported previous spine fracture, 11 (22%) limb fractures, and 17 (33.3%) received lower extremity or orthopedic surgeries before.

Mean T-Scores and standard deviations on the short forms are shown in Table 25. MD patients generally reported better functioning/ less symptom severity than the reference group norm with one exception. The exception was the Social Relations – Interactions with Peers Short Form, on which MD patients scored about 2.5 T-scores worse than the norm.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 25. Cronbach's alphas range from .81 to .98 and ICCs from .61 to .97.

Table 25. Pediatric MD - Descriptive and reliability statistics for Neuro-QoL short form T-scores

| Neuro-QoL Measures | N_{items} | $N_{persons}$ | M_{GPT} | M_{CT} | SD | α | T-R** ICCs |
|---|-------------|---------------|-----------|----------|-------|----------|------------|
| Social Relations – Interactions with Peers* | 8 | 50 | 47.42 | | 10.15 | .90 | .87 |
| Cognitive Function* | 8 | 51 | 50.66 | | 7.02 | .81 | .80 |
| Depression | 8 | 51 | 46.27 | | 8.77 | .91 | .62 |
| Anxiety | 8 | 51 | 50.25 | | 7.45 | .85 | .72 |
| Stigma | 8 | 51 | | 49.29 | 7.26 | .90 | .68 |
| Fatigue | 8 | 51 | 47.10 | | 8.17 | .81 | .66 |
| Pain | 10 | 51 | | 49.58 | 8.76 | .93 | .73 |
| Lower Extremity (Mobility)* ^{NOTE} | 20 | 22 | 54.02*** | | 23.05 | .90 | .65 |
| Upper Extremity (Fine Motor, ADL) * | 20 | 51 | 53.63*** | | 36.13 | .98 | .97 |

* For these banks, a high score indicates better function; for all other banks a high score indicates worse function

** Time 1 (baseline) vs. Time 2 (7-days)

*** These two scales were not calibrated using Item Response Theory models due to skewed distributions. Possible scores range from 0 -100

M_{GPT} – Mean General Population T-Score; M_{CT} – Mean Clinical T-Score

^{NOTE} 28 patients (54.9%) reported using wheelchair only and had missing data on the Lower Extremity Function scale. When assigned “unable to do” for these patients on the Lower Extremity Function items, mean = 23.73.

Validity: Spearman rho correlations between the Neuro-QoL short forms and the pediatric disease measures are shown in Table 26 and between the Neuro-QoL short forms and the cross-disease instruments in Table 27.

Table 26. Correlations for Neuro-QoL short form T-scores with disease-specific measures

Convergent Validity: The global quality of life item “I am content with the quality of my life right now” (20.4% -Not at all or A little bit; 44.9% - Somewhat or Quite a bit; 34.7% - Very much) was used to evaluate the convergent validity of the pediatric Neuro-QoL measures. Depression, Anxiety, and Social Relation-Interaction with Peers were statistically significant, $F=7.32$ ($p=0.002$), 3.51 ($p=0.038$), and 6.10 ($p=0.004$), respectively. Cognitive Function approached significance, $F=2.97$ ($p=.06$). Post-hoc comparisons showed that all significant comparisons were in the predicted direction, with effect size range from 0.75 to 1.58.

Responsiveness: The same 23 planned comparisons as described in pediatric epilepsy were conducted. As in the pediatric epilepsy sample, less than 10 patients reported decline in well-being for each GRC question, thus t-tests were used to compare those that declined or reported no change with those that improved. Results for these responsiveness analyses are presented below. Only those that achieved statistical significance are summarized.

Of the 23 planned comparisons, five were statistically significant.

Social/Family Well-being: Of the two planned comparisons, Stigma was significant, $t=3.57$ ($p=.004$). Those who reported improved social/family well-being reported a greater decrease in stigma scores than those who reported no change or decline in social/family well-being with an effect size of 0.498.

Emotional Well-being: Of the three planned comparisons, Stigma was statistically significant, $t=-6.82$ ($p<0.0001$) effect size of 0.667.. Specifically, patients who reported “better” Emotional Well-being exhibited a greater decrease in stigma score than those who reported no change or a decrease in emotional well-being.

Cognitive Well-being: The one planned comparison was significant. Those who reported no change or decline in cognitive function exhibited decreased scores on the cognitive function measure from time 1 to time 3, $t=2.91$ ($p=0.017$), effect size of -0.261.

Overall Well-being: Of seven planned comparisons, two were significant. Stigma was significant, with those reporting increased overall well-being scoring lower on the stigma measure at time 3 than time 1 ($t=2.79$; $p=.002$) with an effect size of -0.49. Cognitive Function was also significant ($t=3.92$; $p=0.002$). Those reporting no change or decrease in well-being scored lower on the cognitive function measure at time 3 than time 1, with an effect size of -0.28.

Conclusions:

- The 9 Neuro-QoL measures demonstrated high internal consistency (alpha range from 0.81-0.98).
- The Intraclass Correlation Coefficients (ICC) were acceptable, ranging from .62 (Depression) to .97 (Upper Extremity Function- Fine motor, ADL)
- Convergent validity with generic and legacy measures were of the expected strength and direction
- Stigma and Cognitive Function were sensitive to change in all planned comparisons.

General Conclusions/Discussion

This manual summarizes the procedures and initial findings from Neuro-QoL item bank development and clinical validation field testing. Overall, the Neuro-QoL short forms demonstrated excellent internal consistency across all diseases. Test-retest reliability was acceptable, but varied between disease groups. It was uniformly high for stroke and MS, but a few short forms had lower than expected ICCS when used with ALS, PD, adult and pediatric epilepsy, and muscular dystrophy patients. Validity of the Neuro-QoL short forms and scales was supported by 1). correlations with generic and disease-specific measures that were of the expected strength and direction; 2). ability of the short forms to discriminate between patients grouped by disease severity level or other clinical factor. Responsiveness to change studies and clinical research reports will accrue over time.

Additional Neuro-QoL analyses have been performed since the measures were publicly released in 2010. These analyses resulted in the development of a single adult Cognitive Function item bank comprised of items measuring both executive function and general concerns. This bank replaces the Applied Cognition – Executive Function and Applied Cognition – General Concerns item banks. We also recalibrated the pediatric Fatigue and Cognitive Function item banks using data obtained from a general population sample. All related statistics and tables reflect these changes. Work done by others and ourselves has broadened Neuro-QoL's applicability by enabling comparisons to non-neurological conditions. These types of comparisons are made possible by work of the PROsetta Stone (www.prosettastone.org) project, which provides tables to convert scores on Neuro-QoL measures to scores on measures from the Patient Reported Outcome Measurement Information System (PROMIS). Finally, additional translations of Neuro-QoL continue to be developed. The latest translations can be requested through Assessment Center (www.assessmentcenter.net).

For Further Information

Neuro-QoL instruments are freely available at www.assessmentcenter.net. The User Manual, and Technical Report, as well as a list of publications, are posted on the Neuro-QoL website (www.neuroqol.org).

APPENDIX A – Statistics Tables and Figures

Item Statistics- Adult: Included, Excluded, Calibrated, and Uncalibrated

Table 28: IRT parameters for the calibrated items in the *Cognitive Function* bank.

For items NQCOG15r1 through NQCOG40r1, the rating scale is: 5 = *None*; 4 = *A little*; 3 = *Somewhat*; 2 = *A lot*; 1 = *Cannot Do*.

For items NQCOG46r1 through NQCOG86r1, item context is *In the past 7 days*, and the rating scale is: 5= *Never*; 4= *Rarely (once)*; 3 = *Sometimes (2-3 times)*; 2 = *Often (once a day)*; 1= *Very Often (several times a day)*

| Neuro-QoL Item Name | PROMIS Item Name | Item Content | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|---------------------|------------------|---|------------|-------------|-------------|-------------|-------------|
| NQCOG15r1 | | How much DIFFICULTY do you currently have keeping track of time (eg., using a clock)? | 1.48 | -3.50 | -2.27 | -1.31 | -0.37 |
| NQCOG16r1 | | How much DIFFICULTY do you currently have checking the accuracy of financial documents, (e.g., bills, checkbook, or bank statements)? | 1.77 | -3.22 | -1.87 | -1.09 | -0.20 |
| NQCOG22r1 | | How much DIFFICULTY do you currently have reading and following complex instructions (e.g., directions for a new medication)? | 1.99 | -2.78 | -1.93 | -1.05 | -0.18 |
| NQCOG24r1 | | How much DIFFICULTY do you currently have planning for and keeping appointments that are not part of your weekly routine, (e.g., a therapy or doctor appointment, or a social gathering with friends and family)? | 2.00 | -3.02 | -1.88 | -0.97 | -0.13 |
| NQCOG25r1 | | How much DIFFICULTY do you currently have managing your time to do most of your daily activities? | 1.91 | -2.94 | -1.86 | -0.85 | 0.22 |
| NQCOG26r1 | | How much DIFFICULTY do you currently have planning an activity several days in advance (e.g., a meal, trip, or visit to friends)? | 2.02 | -3.06 | -1.83 | -0.91 | -0.18 |
| NQCOG31r1 | | How much DIFFICULTY do you currently have getting things organized? | 1.79 | -2.86 | -1.68 | -0.81 | 0.30 |
| NQCOG38r1 | | How much DIFFICULTY do you currently have remembering where things were placed or put away (e.g., keys)? | 1.87 | -3.04 | -1.82 | -0.83 | 0.45 |
| NQCOG39r1 | | How much DIFFICULTY do you currently have remembering a list of 4 or 5 errands without writing it down? | 1.75 | -2.57 | -1.50 | -0.61 | 0.68 |
| NQCOG40r1 | | How much DIFFICULTY do you currently have learning new tasks or instructions? | 2.27 | -2.75 | -1.80 | -0.90 | 0.10 |
| NQCOG46r1 | | I made simple mistakes more easily. | 2.51 | -2.28 | -1.74 | -0.87 | 0.29 |
| NQCOG53r1 | | Words I wanted to use seemed to be on the “tip of my tongue.” | 1.90 | -2.38 | -1.56 | -0.45 | 0.86 |

| | | | | | | | |
|------------------|--|---|------|-------|-------|-------|-------|
| NQCOG64r1 | | I had to read something several times to understand it. | 2.28 | -2.36 | -1.61 | -0.56 | 0.53 |
| NQCOG65r1 | | I had trouble keeping track of what I was doing if I was interrupted. | 3.25 | -2.14 | -1.39 | -0.63 | 0.34 |
| NQCOG66r1 | | I had difficulty doing more than one thing at a time. | 3.16 | -1.98 | -1.46 | -0.62 | 0.18 |
| NQCOG67r1 | | I had trouble remembering whether I did things I was supposed to do, like taking a medicine or buying something I needed. | 2.35 | -2.25 | -1.53 | -0.73 | 0.11 |
| NQCOG68r1 | | I had trouble remembering new information, like phone numbers or simple instructions. | 2.59 | -2.09 | -1.43 | -0.73 | 0.10 |
| NQCOG69r1 | | I walked into a room and forgot what I meant to get or do there. | 1.67 | -2.61 | -1.62 | -0.53 | 0.80 |
| NQCOG70r1 | | I had trouble remembering the name of a familiar person. | 2.53 | -2.45 | -1.64 | -0.85 | 0.01 |
| NQCOG72r1 | | I had trouble thinking clearly. | 3.74 | -1.95 | -1.41 | -0.76 | 0.05 |
| NQCOG73r1 | | I reacted slowly to things that were said or done. | 3.93 | -1.95 | -1.41 | -0.79 | -0.07 |
| NQCOG74r1 | | I had trouble forming thoughts. | 3.10 | -1.89 | -1.41 | -0.81 | -0.11 |
| NQCOG75r1 | | My thinking was slow. | 3.23 | -1.86 | -1.37 | -0.75 | -0.06 |
| NQCOG77r1 | | I had to work really hard to pay attention or I would make a mistake. | 3.02 | -1.96 | -1.36 | -0.70 | 0.01 |
| NQCOG80r1 | | I had trouble concentrating. | 3.32 | -1.90 | -1.41 | -0.61 | 0.20 |
| NQCOG83r1 | | I had trouble getting started on very simple tasks. | 3.47 | -1.93 | -1.40 | -0.75 | -0.03 |
| NQCOG84r1 | | I had trouble making decisions. | 3.18 | -1.96 | -1.36 | -0.70 | 0.03 |
| NQCOG86r1 | | I had trouble planning out steps of a task. | 3.73 | -2.04 | -1.45 | -0.83 | -0.12 |

Table 29: Uncalibrated items from the *Cognitive Function* bank.

For items item, the item context is *In the past 7 days*, and the response scale is: 5= *Never*; 4= *Rarely (once)*; 3= *Sometimes (2-3 times)*; 2= *Often (once a day)*; 1= *Very Often (several times a day)*

| Neuro-QoL Item Name | Item Content |
|----------------------------|---|
| NQCOG43 | I got confused, for example, I did not know where I was. |
| NQCOG44 | I had difficulty paying attention for a long period of time. |
| NQCOG45 | I felt like my mind went blank. |
| NQCOG47 | After I made a mistake, I got stuck and couldn't figure out a new way to go. |
| NQCOG48 | "I had trouble recognizing my mistakes right away |
| NQCOG49 | I had trouble saying what I mean in conversations with others. |
| NQCOG50 | I was told that I start talking before the other person finishes. |
| NQCOG51 | I was told that I repeat myself. |
| NQCOG52 | I was a worse listener than usual |
| NQCOG54 | I had trouble finding the right word(s) to express myself. |
| NQCOG55 | I used the wrong word when I referred to an object. |
| NQCOG56 | I communicated by gestures, for example, moving my head, pointing or sign language. |
| NQCOG57 | My speech was understood only by a few people who know me well. |
| NQCOG58 | I had to repeat myself so others could understand me. |
| NQCOG59 | I slurred or stuttered while speaking. |
| NQCOG60 | I had to talk very slowly to make myself understood. |
| NQCOG62 | I had trouble recalling the name of an object. |
| NQCOG63 | I had trouble recognizing familiar words on a page. |
| NQCOG71 | I forgot to do things like turn off the stove or turn on my alarm clock. |
| NQCOG76 | My thinking was confused. |
| NQCOG78 | I had trouble adding or subtracting numbers in my head. |
| NQCOG79 | I made mistakes when writing down phone numbers. |
| NQCOG81 | I had trouble spelling words correctly when writing. |
| NQCOG82 | I had trouble keeping track of the day or date. |
| NQCOG85 | When I had something to do that takes a long time, I had trouble deciding where to start. |
| NQCOG87 | I needed medical instructions repeated because I could not keep them straight. |
| NQCOG88 | When I was reading I needed to use a ruler or my finger to keep track of which line I was on. |

For each item, the item context is *How much DIFFICULTY do you currently have...*, and the response scale is: 5= None; 4= A little; 3= Somewhat; 2= A lot; 1= Cannot Do

| Neuro-QoL Item Name | Item Content |
|----------------------------|---|
| NQCOG05 | making yourself understood to familiar people over the phone? |
| NQCOG06 | making yourself understood to other people during ordinary conversations? |
| NQCOG07 | describing something that has happened to you so that others can understand you? |
| NQCOG09 | putting words together to form grammatically correct sentences? |
| NQCOG12 | reading simple material (e.g., a menu or the TV or radio guide)? |
| NQCOG13 | reading the newspaper or magazine? |
| NQCOG14 | understanding information on food labels? |
| NQCOG17 | counting the correct amount of money when making purchases? |
| NQCOG18 | doing calculations in your head while shopping (e.g., 30% off, etc.)? |
| NQCOG19 | using information on the bill to figure out where to call if you have a problem? |
| NQCOG20 | carrying on a conversation with a familiar person in a noisy environment (e.g., at a party or meeting)? |
| NQCOG21 | following a series of dialing instructions (e.g., a recorded message "Press 1 for...")? |
| NQCOG23 | looking up a phone number or address in the phone book? |
| NQCOG27 | have taking care of complicated tasks like managing a checking account or getting appliances fixed? |
| NQCOG28 | do you currently have keeping important personal papers such as bills, insurance documents and tax forms organized? |
| NQCOG29 | handling an unfamiliar problem (e.g., getting the refrigerator fixed)? |
| NQCOG30 | planning for and completing regularly scheduled weekly tasks, such as taking out the trash or doing laundry? |
| NQCOG32 | planning what to do in the day? |
| NQCOG33 | explaining how to do something involving several steps to another person? |
| NQCOG34 | using a local street map to locate a new store or doctor's office? |
| NQCOG35 | dialing familiar numbers such as a family member or doctor (without losing your place or misdialing)? |
| NQCOG36 | reading a long book (over 100 pages) over a number of days? |
| NQCOG37 | remembering to take medications at the appropriate time? |
| NQCOG41 | using a map to tell where to go? |
| NQCOG42 | understanding pictures that explain how to assemble something? |

Table 30: Items excluded from the *Cognitive Function* item bank

For each item, the item context is *How much DIFFICULTY do you currently have...*, and the response scale is: 5= *None*; 4= *A little*; 3= *Somewhat*; 2= *A lot*; 1= *Cannot Do*

| Neuro-QoL Item Name | Item Content |
|----------------------------|---|
| NQCOG01 | writing notes to yourself, such as appointments or 'to do' lists? |
| NQCOG02 | composing a brief note or e-mail to someone? |
| NQCOG03 | understanding familiar people during ordinary conversations? |
| NQCOG04 | understanding family and friends on the phone? |
| NQCOG08 | carrying on a conversation with a small group of familiar people (e.g., family or a few friends)? |
| NQCOG10 | organizing what you want to say? |
| NQCOG11 | speaking clearly enough to use the telephone? |
| NQCOG61 | My speech was difficult for others to understand |

Table 31: IRT parameters for the calibrated items in the *Upper Extremity* bank.

For items NQUEX03 through NQUEX15, the rating scale is: 5 = *No Difficulty*; 4 = *A Little Difficulty*; 3 = *Some Difficulty*; 2 = *A Lot of Difficulty*; 1 = *Can't Do*.
 For items NQUEX19 through NQUEX44, the rating scale is: 5 = *Without Any Difficulty*; 4 = *With a Little Difficulty*; 3 = *With Some Difficulty*; 2 = *With Much Difficulty*; 1 = *Unable to Do*.

| Neuro-QoL Item Name | PROMIS Item Name | Item Content | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|---------------------|------------------|---|------------|-------------|-------------|-------------|-------------|
| NQUEX03 | | How much DIFFICULTY do you currently have using a spoon to eat a meal? | 2.66 | -3.71 | -3.12 | -2.39 | -1.94 |
| NQUEX04 | | How much DIFFICULTY do you currently have putting on a pullover shirt? | 3.95 | -3.05 | -2.50 | -2.01 | -1.39 |
| NQUEX05 | | How much DIFFICULTY do you currently have taking off a pullover shirt? | 3.63 | -3.06 | -2.48 | -1.94 | -1.29 |
| NQUEX06 | | How much DIFFICULTY do you currently have removing wrappings from small objects? | 3.25 | -3.06 | -2.19 | -1.64 | -1.04 |
| NQUEX15 | | How much DIFFICULTY do you currently have opening medications or vitamin containers (e.g., childproof containers, small bottles)? | 2.51 | -2.99 | -2.27 | -1.75 | -0.99 |
| NQUEX19 | PFA22 | Are you able to open previously opened jars? | 2.87 | -3.22 | -2.73 | -2.16 | -1.47 |
| NQUEX20 | PFA50 | Are you able to brush your teeth? | 3.13 | -3.66 | -3.22 | -2.68 | -2.03 |
| NQUEX23 | PFB22 | Are you able to hold a plate full of food? | 3.62 | -2.68 | -2.30 | -1.92 | -1.38 |
| NQUEX28 | PFA35 | Are you able to open and close a zipper? | 4.24 | -2.86 | -2.29 | -2.03 | -1.47 |
| NQUEX29 | PFA40 | Are you able to turn a key in a lock? | 4.68 | -2.95 | -2.55 | -2.11 | -1.63 |
| NQUEX30 | PFA43 | Are you able to write with a pen or pencil? | 2.11 | -3.97 | -2.61 | -2.00 | -1.43 |
| NQUEX31 | PFA47 | Are you able to pull on trousers? | 3.50 | -3.03 | -2.57 | -2.01 | -1.33 |
| NQUEX32 | PFA54 | Are you able to button your shirt? | 4.19 | -2.51 | -2.07 | -1.68 | -1.17 |
| NQUEX33 | PFA55 | Are you able to wash and dry your body? | 3.51 | -2.98 | -2.56 | -1.98 | -1.44 |
| NQUEX36 | PFB21 | Are you able to pick up coins from a table top? | 3.08 | -3.32 | -2.57 | -2.01 | -1.33 |
| NQUEX37 | PFB26 | Are you able to shampoo your hair? | 3.54 | -2.78 | -2.50 | -2.15 | -1.64 |
| NQUEX38 | PFB41 | Are you able to trim your fingernails? | 3.66 | -2.25 | -2.02 | -1.75 | -1.27 |
| NQUEX39 | PFA46 | Are you able to cut your toe nails? | 2.60 | -1.98 | -1.68 | -1.23 | -0.61 |
| NQUEX41 | PFA09 | Are you able to bend down and pick up clothing from the floor? | 2.26 | -2.94 | -2.32 | -1.74 | -1.07 |
| NQUEX44 | | Are you able to make a phone call using a touch tone key-pad? | 2.45 | -3.94 | -3.47 | -2.76 | -2.08 |

Table 32: Uncalibrated items from the *Upper Extremity* bank.

| Neuro-QoL Item Name | PROMIS Item Name | Item Content | Rating Scale |
|--------------------------------|-----------------------------|---|--|
| NQUEX01 | | How much DIFFICULTY do you currently have using a fork to eat a meal? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX02 | | How much DIFFICULTY do you currently have applying spreads to bread using a knife? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX07 | | How much DIFFICULTY do you currently have chopping or slicing vegetables (e.g., onions or peppers)? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX08 | | How much DIFFICULTY do you currently have reaching behind your back to put a belt through a loop? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX09 | | How much DIFFICULTY do you currently have shaving your neck and face safely and thoroughly with an electric razor? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX10 | | How much DIFFICULTY do you currently have shaving your legs and underarms safely and thoroughly with an electric razor? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX11 | | How much DIFFICULTY do you currently have playing cards or Bingo or other light recreational activities? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |

| Neuro-QoL Item Name | PROMIS Item Name | Item Content | Rating Scale |
|--------------------------------|-----------------------------|---|--|
| NQUEX12 | | How much DIFFICULTY do you currently have picking up a gallon carton of milk with one hand and setting it on the table? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX13 | | How much DIFFICULTY do you currently have pounding a nail with a hammer to hang a picture? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX14 | | How much DIFFICULTY do you currently have holding a screw and screwing it in tight with a manual screwdriver? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX16 | | How much DIFFICULTY do you currently have cleaning yourself after a bowel movement? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX17 | | How much DIFFICULTY do you currently have pulling up and fastening your pants after a bowel movement? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQUEX18 | | How much DIFFICULTY do you currently have putting a Band-Aid or gauze pad on yourself? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |

| NQASD07 | | How much DIFFICULTY do you currently have going up and down a flight of stairs inside, using a handrail with your walking aid? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQASD09 | | How much DIFFICULTY do you currently have getting into and out of a truck, bus, shuttle van, or sport utility vehicle from a wheelchair? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQASD10 | | How much DIFFICULTY do you currently have descending 3-5 stairs without a handrail with your walking aid? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQASD11 | | How much difficulty do you currently have going for a walk of at least 15 minutes with your walking aid? | 5 = Without any difficulty 4 = With a little difficulty 3 = With some difficulty 2 = With much difficulty 1 = Unable to do |
| NQASD12 | | Are you able to get in and out of a car with your walking aid? | 5 = Without any difficulty 4 = With a little difficulty 3 = With some difficulty 2 = With much difficulty 1 = Unable to do |
| NQASD13 | | Are you able to get in and out of a car from a wheelchair? | 5 = Without any difficulty 4 = With a little difficulty 3 = With some difficulty 2 = With much difficulty 1 = Unable to do |

Table 35: IRT parameters for the *Fatigue* item bank

For each item, item context is *In the past 7 days*, and the rating scale is: 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*

| Neuro-QoL Item Name | Item Stem | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|------------------------|--|------------|-------------|-------------|-------------|-------------|
| NQFTG01 | I needed help doing my usual activities because of my fatigue. | 2.72 | -0.68 | 0.00 | 0.94 | 1.86 |
| NQFTG02 | I had to limit my social activity because I was tired. | 3.61 | -0.75 | -0.13 | 0.75 | 1.91 |
| NQFTG03 | I needed to sleep during the day. | 1.89 | -1.20 | -0.41 | 0.84 | 1.88 |
| NQFTG04 | I had trouble starting things because I was too tired. | 3.84 | -0.92 | -0.25 | 0.82 | 1.88 |
| NQFTG05 | I had trouble finishing things because I was too tired. | 3.74 | -1.05 | -0.30 | 0.80 | 1.92 |
| NQFTG06 | I was too tired to do my household chores. | 4.24 | -0.96 | -0.25 | 0.66 | 1.67 |
| NQFTG07 | I was too tired to leave the house. | 3.94 | -0.60 | 0.05 | 0.94 | 1.91 |
| NQFTG08 | I was too tired to take a short walk. | 2.97 | -0.68 | -0.09 | 0.69 | 1.57 |
| NQFTG09 | I was too tired to eat. | 2.71 | -0.20 | 0.69 | 1.81 | 2.72 |
| NQFTG10 | I was frustrated by being too tired to do the things I wanted to do. | 4.15 | -0.72 | -0.24 | 0.43 | 1.17 |
| NQFTG11 | I felt that I had no energy. | 4.58 | -1.18 | -0.42 | 0.33 | 1.30 |
| NQFTG12 | I was so tired that I needed to rest during the day. | 3.52 | -1.11 | -0.38 | 0.62 | 1.42 |
| NQFTG13 | I felt exhausted. | 4.68 | -0.93 | -0.25 | 0.60 | 1.42 |
| NQFTG14 | I felt tired. | 3.99 | -1.64 | -0.74 | 0.31 | 1.34 |
| NQFTG15 | I felt fatigued. | 4.53 | -1.30 | -0.47 | 0.41 | 1.37 |
| NQFTG16 | I felt weak all over. | 3.13 | -0.66 | 0.04 | 0.89 | 1.69 |
| NQFTG17 | I needed help doing my usual activities because of weakness. | 3.30 | -0.27 | 0.36 | 1.20 | 2.09 |
| NQFTG18 | I had to limit my social activity because I was physically weak. | 3.29 | -0.28 | 0.36 | 1.04 | 1.85 |
| NQFTG20 | I had to force myself to get up and do things because I was physically too weak. | 3.15 | -0.36 | 0.26 | 1.04 | 2.01 |

The Fatigue Item Bank had one uncalibrated item: (NQFTG19) I had enough physical strength to do the things I wanted to do.

Table 36: IRT parameters for the *Sleep Disturbance* short form

For each item, the item context is *In the past 7 days*, and the rating scale is: 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*

| Neuro-QoL Item Name | Item Stem | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|------------------------|--|------------|-------------|-------------|-------------|-------------|
| NQSLP02 | I had to force myself to get up in the morning. | 1.59 | -0.59 | 0.32 | 1.33 | 2.29 |
| NQSLP03 | I had trouble stopping my thoughts at bedtime. | 2.30 | -0.59 | 0.14 | 1.03 | 2.00 |
| NQSLP04 | I was sleepy during the daytime. | 1.60 | -1.82 | -0.77 | 0.69 | 1.95 |
| NQSLP05 | I had trouble sleeping because of bad dreams. | 1.67 | 0.53 | 1.57 | 2.53 | 3.52 |
| NQSLP07 | I had trouble falling asleep. | 2.24 | -0.62 | 0.28 | 1.26 | 2.15 |
| NQSLP12 | Pain woke me up. | 1.34 | 0.05 | 0.84 | 2.00 | 3.45 |
| NQSLP13 | I avoided or cancelled activities with my friends because I was tired from having a bad night's sleep. | 2.47 | 0.50 | 1.12 | 2.09 | 2.97 |
| NQSLP18 | I felt physically tense during the middle of the night or early morning hours. | 1.80 | 0.57 | 1.13 | 2.31 | 3.76 |

Table 37: Uncalibrated items for the *Sleep Disturbance* short form

For each item, the item context is *In the past 7 days*, and the rating scale is: 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*

| Neuro-QoL Item Name | Item Stem |
|---------------------|--|
| NQSLP19 | During the night I was awakened by stiffness and had trouble getting back to sleep. |
| NQSLP20 | I had restless feelings in my legs in the evening or night. |
| NQSLP08 | I had an urge to move my legs when I was sitting still or lying down. |
| NQSLP09 | My legs jerked or twitched repeatedly during sleep. |
| NQSLP10 | I experienced numbness or tingling in my arms or legs which woke me from sleep at night. |
| NQSLP14 | I had hallucinations at night (seeing or hearing things that do not exist). |
| NQSLP16 | I screamed during sleep. |
| NQSLP17 | I kicked, punched, or swung my arms during sleep. |

Table 38: Items excluded from the *Sleep Disturbance* short form

For each item, the item context is: *In the past 7 days*, and the rating scale is: 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*

| Neuro-QoL Item Name | PROMIS Item Name | Item Stem |
|---------------------|------------------|---|
| NQSLP01 | Sleep50 | I woke up too early and could not fall back asleep. |
| NQSLP06 | Sleep87 | I had trouble staying asleep. |
| NQSLP11 | | I experienced tremor upon waking. |
| NQSLP15 | | Taking medicine helped me sleep. |

Table 39: IRT parameters for the *Depression* item bank

For each item, the item context is *In the past 7 days*, and the response scale is: 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*.

| NQSLped33 | | I did things with other kids my age. | 2.88 | -2.73 | -1.73 | -0.57 | 0.51 |
| NQSLped36 | 5055R1 | My friends and I helped each other out. | 2.77 | -2.52 | -1.89 | -0.39 | 0.69 |
| NQSLped38 | | I had fun with my friends. | 3.18 | -2.47 | -1.92 | -0.78 | 0.19 |

Table 63: Uncalibrated items for the pediatric *Social Relations – Interactions with Peers* item bank.

For all items except one, the item context is *In the past 7 days...* .

For all items except one, the rating scale is: 1 = *Never*; 2 = *Almost Never*; 3 = *Sometimes*; 4 = *Often*;

5 = *Almost Always*

For item *NQSCLPed27 (I feel lonely)*, there is no item context; no time frame was used. For this item, the rating scale is 1 = *not at all*; 2 = *a little bit*; 3 = *somewhat*; 4 = *quite a bit*; 5 = *very much*

| Neuro-QoL Item Name | PROMIS Item Name | Item Stem |
|---------------------|------------------|--|
| NQSCLPed01 | | I got along with my classmates. |
| NQSCLPed02 | | I wished I had more friends. |
| NQSCLPed03 | 9019 | I liked being around other kids my age. |
| NQSCLPed04 | | I had trouble getting along with other kids my age. |
| NQSCLPed05 | | I had trouble getting along with my family. |
| NQSCLPed06 | | I was mean to other people. |
| NQSCLPed17 | | I felt different from other kids my age. |
| NQSCLPed23 | | I worried about losing friends. |
| NQSCLPed24 | | I got into fights (hitting, kicking, pushing) with other kids. |
| NQSCLPed27 | | I feel lonely. |
| NQSCLPed35 | | Because of my health, I missed out on important activities. |

One item, NQSCLPed07, I teased other kids, was excluded from the bank altogether.

Table 64: Items for the pediatric *Social Relations – Interactions with Adults* item pool.

For each item, the item context is *In the past 7 days...*; the rating scale is: 1 = *Never*; 2 = *Almost Never*; 3 = *Sometimes*; 4 = *Often*; 5 = *Almost Always*

| Neuro-QoL Item Name | Item Stem |
|--------------------------------|--|
| NQSCLped08 | I got along with my parents or guardians. |
| NQSCLped13 | I felt loved by my parents or guardians. |
| NQSCLped14 | I was happy at home. |
| NQSCLped15 | My parents or guardians spent enough time with me. |
| NQSCLped16 | I got along well with my teachers. |
| NQSCLped21 | My teachers accepted me. |
| NQSCLped22 | My teachers respected me. |
| NQSCLped25 | My parents or guardians seem to know what's important to me. |
| NQSCLped34 | I felt comfortable talking with my parents or guardians. |
| NQSCLped37 | I argued with my parents or other adults. |

Table 65: IRT parameters for the pediatric *Fatigue* item bank.

For each item, the item context is *In the past 7 days...* ; for non-reversed items the rating scale is: 1 = none of the time; 2 = a little bit of time; 3 = some of the time; 4 = most of the time; 5 = all of the time.

| Neuro-QoL Item Name | Item Stem | Rating Scale | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |

| NQFTGped01 | I felt tired. | | 2.11 | -1.45 | -0.23 | 1.20 | 2.23 |
| NQFTGped04 | I had trouble <u>starting</u> things because I was too tired. | | 2.11 | -0.44 | 0.61 | 1.69 | 2.82 |
| NQFTGped05 | I had trouble <u>finishing</u> things because I was too tired. | | 2.11 | -0.50 | 0.65 | 1.59 | 2.42 |
| NQFTGped06 | I needed to sleep during the day. | | 2.11 | -0.09 | 0.49 | 1.31 | 2.13 |
| NQFTGped08 | Being tired made it hard to play or go out with my friends as much as I would like. | | 2.11 | 0.13 | 0.83 | 1.42 | 2.29 |
| NQFTGped11r1 | I was too tired to eat. | | 2.11 | 0.99 | 1.63 | 2.58 | |
| NQFTGped12 | Being tired makes me sad. | | 2.11 | 0.41 | 0.94 | 1.76 | 2.27 |
| NQFTGped13 | Being tired makes me mad. | | 2.11 | 0.28 | 0.89 | 1.55 | 2.33 |
| NQFTGped07 | I got upset by being too tired to do things I wanted to do. | | 2.11 | -0.03 | 0.77 | 1.53 | 2.22 |
| NQFTGped09 | I needed help doing my usual things at home. | | 2.11 | -0.08 | 0.66 | 1.31 | 1.92 |
| NQFTGped10 | I felt weak. | | 2.11 | -0.09 | 0.78 | 1.50 | 2.64 |

* The current version 2.1 Pediatric Fatigue Item Bank does not include two positively worded items “NQFTGped02: In the past 7 days... I had energy (or strength)”, and “NQFTGped03: In the past 7 days... I could do my usual things at home” to minimize confusion from children who need to complete both positively and negatively worded items in one instrument. Since these two items were included in version 1.0 Pediatric Fatigue Item Bank, item bank characteristic of the re-calibrated 13-item version (v2.0) are also included in table 73.

Table 66: IRT parameters for the pediatric *Pain* short form.

For each item, the item context is *In the past 7 days*.

For all items except one, the rating scale is: 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*.

*** For item *NQPAIped07 (When you had pain, how long did it last?)*, the rating scale is: 1 = *few seconds*; 2 = *few minutes*; 3 = *few hours*; 4 = *few days (less than a week)*; 5 = *more than a week*

| Neuro-QoL Item Name | PROMIS Item Name | Item Stem | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|---------------------|------------------|---|------------|-------------|-------------|-------------|-------------|
| NQPAIped01 | | I had a lot of pain. | 3.96 | -0.02 | 0.56 | 1.31 | 1.87 |
| NQPAIped02 | | My pain was so bad that I needed to take medicine for it. | 3.96 | 0.33 | 0.78 | 1.27 | 1.46 |
| NQPAIped03 | 2032R1 | I missed school when I had pain. | 3.96 | 0.47 | 0.80 | 1.46 | 2.31 |
| NQPAIped04 | | I had so much pain that I had to stop what I was doing. | 3.96 | 0.42 | 0.84 | 1.44 | 1.90 |
| NQPAIped05 | 9009 | I hurt all over my body. | 3.96 | 0.54 | 1.00 | 1.46 | 2.11 |
| NQPAIped06 | | I had pain. | 3.96 | -0.18 | 0.53 | 1.29 | 1.90 |
| *** NQPAIped07 | | When you had pain, how long did it last? | 3.96 | -0.23 | 0.55 | 1.15 | 1.73 |
| NQPAIped08 | 3793R1 | I had trouble sleeping when I had pain. | 3.96 | 0.20 | 0.62 | 1.12 | 1.66 |
| NQPAIped09 | | I had trouble watching TV when I had pain. | 3.96 | 0.65 | 1.03 | 1.46 | 1.88 |
| NQPAIped10 | | It was hard for me to play or hang out with my friends when I had pain. | 3.96 | 0.18 | 0.79 | 1.27 | 1.53 |

Table 67: Items for the pediatric *Lower Extremity Function (Mobility)* scale.

For each item, the item context is *In the past 7 days...*

| Neuro-QoL Item Name | PROMIS Item Name | Item Stem | Rating Scale |
|---------------------|------------------|---|--|
| NQMOBped02r1 | 2647R2 | I could get down on my knees without holding on to something. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped03r1 | 236R1 | I could keep up when I played with other kids. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped04r1 | | I could walk for 15 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped05r1 | | I could walk between rooms. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped08r1 | | I could get on and off the toilet without using my arms. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped09r1 | | I could get on and off a low chair. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped13r1 | | I could get up from the floor by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped14r1 | | I could sit on a bench without support for 15 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

| Neuro-QoL Item Name | PROMIS Item Name | Item Stem | Rating Scale |
|---------------------|------------------|--|--|
| NQMOBped17r1 | | I could stand on my tiptoes to reach for something. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped18r1 | | I could stand on my tiptoes to put something (e.g., 5 lb bag of sugar) on a shelf. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped21r1 | | I could walk on slightly uneven surfaces (such as cracked pavement). | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped24r1 | | I could walk on rough, uneven surfaces (such as lawns, gravel driveway). | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped25r1 | | I could walk up and down ramps or hills. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped26r1 | | I could walk up and down curbs. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped29r1 | | I could get in and out of a bus. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped30r1 | 2118R1 | I could get in and out of a car. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped31r1 | 2202R2 | I could walk across the room. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

| Neuro-QoL Item Name | PROMIS Item Name | Item Stem | Rating Scale |
|---------------------|------------------|--|--|
| NQMOBped32r1 | | I could walk while wearing a backpack full of books. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped33r1 | 676R1 | I could bend over to pick something up. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped35r1 | | I could do exercise that others my age can do. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

Table 68: Items excluded from the pediatric *Lower Extremity Function (Mobility)* scale.

For each item, the item context is *In the past 7 days...*

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|---|--|
| NQMOBped01 | I could keep my balance while walking for 30 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped06 | I could run as fast as others my own age. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped07 | I could get on and off the toilet. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped10 | I could get in and out of an adult-sized chair. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped11 | I could get on and off a chair without using my arms. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped12 | I could walk for 30 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped15 | I could sit on a bench without back support for 30 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|--|--|
| NQMOBped16 | I could keep my balance while walking for 15 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped19 | I could turn my head all the way to the side to look at someone or something. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped22 | I lose my balance easily. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped23 | I have trouble keeping up with other kids my age when walking. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped27 | I could run for 15 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped28 | I could run for 30 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped34 | I could do sports that others my age can do. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped36 | I could carry bags (such as shopping bags) while going up a full flight of stairs. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|--|--|
| NQMOBped37 | I could carry bags (such as shopping bags) while going down a full flight of stairs. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped38 | I could ride a bicycle. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQMOBped39 | I could walk up 2-3 stairs. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

Table 69: Items for the *Upper Extremity Function (Fine motor, Activities of Daily Living)* pediatric scale.

For each item, the item context is *In the past 7 days...* .

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|--|--|
| NQUExp03r1 | I was able to use my fingers to point to something. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp04r1 | I was able to take off my socks. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp05r1 | I was able to put on and fasten my pants by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp06r1 | I was able to button and unbutton my shirt. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp11r1 | I was able to use a spoon to bring food up to my mouth. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp13r1 | I was able to wipe myself thoroughly after using the toilet. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp14r1 | I was able to pull my pants back up after using the toilet. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp15r1 | I was able to hold a plate full of food. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|---|--|
| NQUExped19r1 | I was able to cut a piece of paper in half with scissors. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExped24r1 | I was able to take a shower by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

Table 70: Items excluded from the *Upper Extremity Function (Fine motor, Activities of Daily Living)* pediatric scale.

For each item, the item context is *In the past 7 days...*

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|---|--|
| NQEXped25 | I was able to take a bath by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped29 | I was able to make a phone call using a touch tone key-pad. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped30 | I was able to get out of bed by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped32 | I was able to put on my shoes by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped33 | I was able to open a jar by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped34 | I was able to put toothpaste on my toothbrush by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped35 | I was able to brush my teeth by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped38 | I was able to dry my back with a towel. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|--|--|
| NQEXped40 | I was able to put on my clothes by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped41 | I was able to zip up my clothes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped01 | I was able to open small containers like snack bags or vitamins (regular screw top). | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped02 | I was able to wash and dry my hands without help. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped07 | I was able to unzip my pants. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped08 | I was able to hold a full cup of water in my hand. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped09 | I was able to wash my hair without help. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped10 | I was able to lift a cup of water to my mouth without spilling. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQEXped12 | I was able to use a knife to spread butter or jelly on bread. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|---|--|
| NQUExped16 | I was able to carry a tray of food in a cafeteria or restaurant. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExped17 | I was able to pick up a gallon of milk with one hand and set it on the table. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExped18 | I was able to get in and out of a tub without help. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExped20 | I was able to style my hair by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExped21 | I was able to cover my nose when sneezing. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExped22 | I was able to use a computer mouse. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExped23 | I was able to open a can of soda. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExped26 | I was able to change positions in my bed. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|--|--|
| NQUExp27 | I was able to write a short note by using a pencil or pen. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp28 | I was able to communicate with friends using e-mail or text messaging. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp31 | I was able to get into bed by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp36 | I was able to pull open heavy doors. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |
| NQUExp37 | I was able to open the rings in school binders. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble 0 = Not able to do |

Overview

The National Institute of Neurological Disorders and Stroke (NINDS) funded Neuro-QOL to create a clinically-relevant and psychometrically-robust health-related quality of life (HRQL) assessment tool for both adults and children. The specific goals of Neuro-QOL include: (1) the development of a core set of questions that address dimensions of HRQL that are universal to patients with chronic neurological diseases, (2) the development of supplemental questions that address HRQL concerns specific to particular groups of patients based on disease status and other sociodemographic variables such as age and ethnicity, and (3) to create a publically available, adaptable and sustainable system, which allows clinical researchers to have access to a common item repository and computerized adaptive testing (CAT). The measures are intended to be responsive to the needs of researchers that are working with a variety of neurological disorders across a wide range of settings, which enables the facilitation of comparisons of data across clinical trials that focus on disparate diseases. The Neuro-QOL items, item banks, and scales are the result of a rigorous development process that included literature review, qualitative and cognitive interviewing, general population and clinical population testing, and state-of-the-art item response theory (IRT) analyses. The purpose of this Technical Report is to provide the reader with information about the methodology used to create Neuro-QOL, and to provide additional psychometric information for the items, scales, and banks that are included in Neuro-QOL.

Development of item banks

Based on our assessment of the needs of NINDS-funded researchers, Neuro-QOL focused on five adult conditions (stroke, multiple sclerosis, Parkinson's disease, epilepsy, and amyotrophic lateral sclerosis [ALS]) and two pediatric conditions (epilepsy and muscular dystrophy). The Neuro-QOL item banks and scales were created using a rigorous set of steps, which were guided by best practices, such as those used in the National Institutes of Health (NIH) Patient-Reported Outcomes Management Information System (PROMIS) initiative,¹⁻⁵ as well as guidance from the Food and Drug Administration on the creation of patient-reported outcomes to be used in clinical trials, which in turn are used to support label claims for medications and other medical interventions.⁶ There were six phases of item development: 1) identification of extant items, using a systematic search for existing questions in currently available scales, 2) item classification and selection, 3) item review and revision by trained professionals who reviewed the wording of each question and revised them in accord with conventions adopted by the Neuro-QOL group, 4) focus group input on domain coverage to confirm domain definitions and to identify new areas of item development for future item banks, 5) cognitive interviews with patients to assess their understanding of individual items, and 6) final revision before field testing. Questions that survived this process were field tested and evaluated for use in Neuro-QOL. Beyond these 6 steps, psychometric analyses were used to further refine the sets of Neuro-QOL items that are recommended for further use.

The list of adult and pediatric Neuro-QOL domains is listed in Tables 1 and 2, respectively.

Neuro-QOL investigators and expert consultants identified candidate instruments and items via literature searches and previous item banking projects. (e.g., PROMIS; Cella, et al.2010) ² Our team created an item library, which included information on the time frame of the response requested, the exact wording of the item stem and response options, and any context (e.g., specific instructions) for the respondent to consider when answering questions. For each domain, the investigative team constructed a comprehensive item pool. Some items included in the Neuro-QOL library are from the NIH PROMIS and the Activity Measure for Post Acute Care.⁷ Teams of three or more domain experts then assigned items to the Neuro-QOL domains through an iterative, multi-step process. We then organized items into domains, sub-domains, factors, and facets, and then reviewed items to determine if they should proceed through detailed item review, revision, and testing.

Once all items were assigned to a domain area, content experts systematically removed items from individual pools. Content experts removed items when there was apparent semantic redundancy. In these cases, we selected the item that was more consistent with the concept definition, or the item that was clearest. Some items in development were found to lack cultural relevance or sensitivity, to lack gender neutrality, to be difficult to translate, or to exhibit excessive disease specificity. We discarded these items. Items that survived this initial review underwent a subsequent, more thorough review, which was conducted by two scientists appointed as co-chairs of the content domain, as well as additional, independent content experts. We also revised the majority of the items to ensure general consistency across banks, to assure comprehensiveness in measuring the domain, to ensure clear, understandable and precise language, to easily facilitate linguistic translation, and to maintain adaptability to the data collection and analysis strategies planned.

Teams of domain experts reviewed and synthesized findings to make further decisions about which items to carry forward in testing. Final item pools were reviewed by 63 patients with neurological disorders using telephone-based cognitive interviews in English and Spanish to assess the content validity of items, clarify concepts, and refine language and response options. During interviews, patients reviewed each item in individual semi-structured interviews that focused on item comprehension and relevance. Patients and experts also identified areas for new item development, for which additional items were written or revised. For children, cognitive interviews were conducted with individuals aged 10-18. Overall, the primary goal was to use the data to better understand the dimensional structure of items that specifically pertained to the various domain areas of Neuro-QOL. Additionally, the results informed the revision of items in the item pools and facilitated new item development prior to the first wave of testing.

Sampling and Pilot Testing

Adult samples

A complete discussion of the development and testing of adult items is discussed in Gershon et al.,⁸ Neuro-QOL data collection occurred in two waves from January 31, 2008 to March 10, 2008 for Wave 1a clinical samples for domains targeted to certain neurological conditions and from September 11, 2008 to September 24, 2008 for the Wave 1b U.S. general population sample, and from January 15, 2009 to January 30, 2010 for Wave 2 validation testing. The sampling plan facilitated obtaining item calibrations for the different domain areas, estimating profile scores for varied subgroups, confirming factor structure, and conducting item and bank analyses. We had over 500 candidate items, so participants could not respond to all of the items. We estimated that participants would respond to four questions per minute, with the maximum number of items administered for each respondent approximately 150. This led to a response time on average of 37 minutes.

For Wave 1a, the response data were collected by YouGovPolimetrix (www.polimetrix.com). Their standard respondent pool for an internet-based survey is taken from a predetermined panel of people who typically respond to the company's online surveys. Chosen panelists receive modest compensation (under a \$10 value) for their participation. Wave 1b data was collected through Greenfield Online, which is also an online paneling organization,

who offers a similar service to YouGovPolimetrix. Greenfield Online was chosen for Wave 1b because their services proved more economical for this particular sample and they use a similar method to YouGovPolimetrix.

All participants completed a socio-demographic form consisting of approximately 20 auxiliary items that measured global health perceptions, and socio-demographic variables including age, gender, race/ethnicity, relationship status, educational attainment, and employment status, income, number of hospitalizations, disability days, use of prescription medication, height, weight,. In addition, participants answered a series of health questions about the presence and degree of limitations as they related to multiple neurological conditions affecting adults including stroke, multiple sclerosis, Parkinson's disease, epilepsy and ALS.

For some calibrations, we combined data from multiple samples to overcome difficulties associated with infrequent responses to items and stability of parameter estimates in Item Response Theory models. The nature of adult calibration samples is listed in Table 3.

Pediatric samples

A complete discussion of the development and testing of pediatric items is discussed in Lai et al.⁹ Generic domains (emotional health, social health and physical health) were field tested on samples drawn from the U.S. pediatric general population whereas targeted domains (stigma, fatigue, pain and cognition) were field tested on children with either epilepsy or muscular dystrophy. This was done because the generic item pools could be feasibly answered by a person without a medical condition, whereas the targeted item pools are typically symptoms or side effects of a disease process. We recruited the samples from internet panel companies: Greenfield Online (www.greenfield.com) and YouGovPolimetrix (www.polimetrix.com) for the US general population and clinical samples, respectively. Similar recruitment strategies were used by these two companies. Specifically, companies sent e-mails to invite parents of potential participants from their database to participate in the field testing. Potential participants were screened by the companies via internet to ensure their eligibility (i.e., English-speaking, ages of 10-18, and for disease related domains, with a diagnosis of either epilepsy or muscular dystrophy). After parents signed an online consent on behalf of their children, parents were asked to complete a series of sociodemographic and clinical information questions (for disease samples only) and children then completed appropriate Neuro-QOL items. Because of the difficulty in recruiting children with epilepsy and muscular dystrophy via a panel company, we also recruited eligible patients from epilepsy clinics at Children's Memorial Hospital (Chicago, IL), NorthShore University HealthSystem (Evanston, Illinois) and the University of California at Davis Medical Center. One exception is the physical health related domains – Upper Extremity function (Fine motor, ADL) and Lower Extremity function (Mobility). Items written in these two domains were targeted to children with moderate to severe limitations seen in rehabilitation clinics, so we also tested these items in clinical samples in order to minimize floor effects. Procedures similar to those used by the online panel companies were implemented, except that paper versions of the informed consent and assent forms were used by research staff. After informed consent was obtained from parents of children and assent was obtained from children aged 12 and older, parents completed the demographic and clinical information (clinical sample only) and children completed the Neuro-QOL items. Table 4 presents the nature of the pediatric calibration samples.

Table 1 – Neuro-QoL Domains for Adults

| | | |
|-----------------|------------------|---|
| Physical | Function/Health | Upper Extremity Function – Fine Motor, ADL (Bank) One's ability to carry out various activities involving digital, manual and reach-related functions, ranging from fine motor to self-care (activities of daily living) |
| | | Lower Extremity Function – Mobility (Bank) One's ability to carry out various activities involving the trunk region and increasing degrees of bodily movement, ambulation, balance or endurance. |
| | | Bowel/Bladder Function (Item Pool) Functional problems related to storage and emptying, such as incontinence or constipation, urgency, leakage and discomfort. |
| | | Sexual Function (Item Pool) A person's overall evaluation of, satisfaction with and quality of sexual activities, including interest, discomfort, functioning and ability to achieve orgasm. |
| | Symptoms | Fatigue (Bank) Sensations ranging from tiredness to an overwhelming, debilitating and sustained sense of exhaustion that decreases one's capacity for physical, functional, social and mental activities. |
| | | Sleep Disturbance (Bank) Perceptions of sleep quality, sleep depth, and restoration associated with sleep; perceived difficulties with getting to sleep or staying asleep; and perceptions of the adequacy of and satisfaction with sleep. |
| Mental | Emotional Health | Depression (Bank) Experience of loss and feelings of hopelessness, negative mood (e.g., sadness, guilt), decrease in positive affect (e.g., loss of interest), information-processing deficits (e.g., problems in decision-making), negative views of the self (e.g., self-criticism, worthlessness), and negative social cognition (e.g., loneliness). |
| | | Anxiety (Bank) Unpleasant thoughts and/or feelings related to fear (e.g., fearfulness, feelings of panic), helplessness, worry and hyperarousal (e.g., tension, nervousness, restlessness). |
| | | Stigma (Bank) Perceptions of self and publically enacted negativity, prejudice and discrimination as a result disease-related manifestations. |
| | | Positive Affect and Well-Being (Bank) Aspects of a person's life that relate to a sense of well-being, life satisfaction or an overall sense of purpose and meaning. |
| | | Emotional and Behavioral Dyscontrol (Bank) A set of disease and/or treatment related manifestations including disinhibition, emotional lability, irritability, impatience, and impulsiveness. |
| | | End of Life Concerns (Item Pool) Issues and concerns that emerge at the end of one's life (including basic functioning across physical, social, emotional, cognitive and existential domains, as well as overall satisfaction with care and symptom palliation) |
| | Cognitive Health | Applied Cognition- General Concerns (Bank) Perceived difficulties in everyday cognitive abilities such as memory, attention, and decision making. |
| | | Applied Cognition- Executive Function (Bank) Perceived difficulties in applications of mental function related to planning, organizing, calculating, working with memory and learning. |
| | | Communication Difficulty (Pool) Perceived difficulties related to oral expression, language production, articulation, comprehension and organization. |
| | Social | Ability to Participate in Social Roles and Activities (Bank) Degree of involvement in one's usual social roles, activities and responsibilities, including work, family, friends and leisure |
| | | Satisfaction with Social Roles and Activities (Bank) Satisfaction with involvement in one's usual social roles, activities and responsibilities, including work, family, friends and leisure |

Table 2 – Neuro-QoL Domains for Pediatric Populations

| | | |
|----------------------|------------------|---|
| | Function/Health | Upper Extremity Function – Fine Motor, ADL (Bank) One's ability to carry out various activities involving digital, manual and reach-related functions, ranging from fine motor to self-care (activities of daily living) |
| | | Lower Extremity Function – Mobility (Bank) One's ability to carry out various activities involving the trunk region and increasing degrees of bodily movement, ambulation, balance or endurance. |
| Physical | Symptoms | Fatigue (Bank) Sensations ranging from tiredness to an overwhelming, debilitating and sustained sense of exhaustion that decreases one's capacity for physical, functional, social and mental activities. |
| | | Pain (Bank) An unpleasant sensory or emotional experience associated with actual or potential tissue damage, or described in terms of such damage. Conceptually divided into components of quality (e.g. the nature, characteristics, intensity, frequency, and duration of pain), behaviors (e.g. verbal and nonverbal actions that communicate pain to others) and interference (e.g. impact of pain on physical, mental, and social activities). |
| Mental | Emotional Health | Depression (Bank) Experience of loss and feelings of hopelessness, negative mood (e.g., sadness, guilt), decrease in positive affect (e.g., loss of interest), information-processing deficits (e.g., problems in decision-making), negative views of the self (e.g., self-criticism, worthlessness), and negative social cognition (e.g., loneliness). |
| | | Anxiety (Bank) Unpleasant thoughts and/or feelings related to fear (e.g., fearfulness, feelings of panic), helplessness, worry and hyperarousal (e.g., tension, nervousness, restlessness). |
| | | Stigma (Bank) Perceptions of self and publically enacted negativity, prejudice and discrimination as a result disease-related manifestations. |
| | | Anger Angry mood (e.g., irritability, frustration), verbal aggression, and efforts to control anger. |
| | Cognitive Health | Applied Cognition- General Concerns (Bank) Perceived difficulties in everyday cognitive abilities such as memory, attention, concentration, processing speed and organization skill. |
| Social Health | | Social Relations – Interaction with Peers (Bank) Degree of involvement with one's peers in usual social roles, activities and responsibilities |
| | | Social Relations – Interaction with Adults (Bank) Degree of involvement with adults in one's usual social roles, activities and responsibilities |

Table 3 – Calibration samples for adult items

| Sub-domain | Status | Calibration Sample |
|--|------------------------|---|
| Upper Extremity Function - Fine Motor, ADL | Item bank | Wave 1b (General Population) + Wave 2 |
| Lower Extremity Function - Mobility | Item bank | Wave 1b (General Population) + Wave 2 |
| Urinary/Bladder Function | Item pool – Not tested | <i>Not tested</i> |
| Bowel Function | Item pool – Not tested | <i>Not tested</i> |
| Sexual Function | Item pool – Not tested | <i>Not tested</i> |
| Fatigue | Item bank | Wave 1a |
| Sleep Disturbance | Item bank | Wave 1a + Wave 2 (|
| Depression | Item bank | Wave 1b (General Population) |
| Anxiety | Item bank | Wave 1b (General Population) ¹ |
| Stigma | Item bank | Wave 1a |
| Positive Affect and Well-Being | Item bank | Wave 1b |
| Emotional and Behavioral Dyscontrol | Item bank | Wave 1a |
| End of Life Concerns | Item pool – Not tested | <i>Not tested</i> |
| Applied Cognition- General Concerns | Item bank | Wave 1b (General Population) + Wave 2 |
| Applied Cognition- Executive Function | Item bank | Wave 1b (General Population) + Wave 2 |
| Communication | Item pool | <i>Not calibrated</i> |
| Ability to Participate in Social Roles and Activities | Item bank | Wave 1b |
| Satisfaction with Social Roles and Activities | Item bank | Wave 1b |

Sample sizes:

Note: Some participants were dropped from some IRT analyses due to missing data.

Wave 1a; $N = 553$ clinical participants (stroke, $n = 209$; epilepsy, $n = 183$; multiple sclerosis, $n = 84$; Parkinson's, $n = 59$; ALS, $n = 18$)

Wave 1b; Participants were divided into four groups (A-D). Group A completed the *Ability to Participate in Social Roles and Activities* and *Satisfaction with Social Roles and Activities* items, $N = 549$. Group B completed *Lower Extremity (Mobility)* items and the *Upper Extremity (Fine Motor, ADL)* items, $N = 518$. Group C completed the *Positive Affect and Well-Being*, *Depression*, and *Anxiety* items, $N = 513$. Group D completed the *Applied Cognition – General Concerns* items, $N = 533$.

Wave 2; $N = 581$ clinical participants (stroke, $n = 101$; epilepsy, $n = 119$; multiple sclerosis, $n = 161$; Parkinson's, $n = 120$; ALS, $n = 80$)

Table 4 – Calibration samples for pediatric items

| Sub-domain | Status | Calibration Sample |
|--|---------------|---|
| Depression | Item bank | Wave 1b (General Population) |
| Anxiety | Item bank | Wave 1b (General Population) |
| Anger | Item bank | Wave 1b (General Population) |
| Upper Extremity Function ^a | Scale | <i>Not calibrated</i> |
| Lower Extremity Function ^a | Scale | <i>Not calibrated</i> |
| Sociability ^b | Item bank | Wave 1b (General Population) – Items only for <i>Interactions with peers</i> were calibrated. |
| Social Role Performance | Item pool | <i>Not calibrated</i> |
| Fatigue | Item bank | Wave 1a + Wave 2 (muscular dystrophy and epilepsy) |
| Pain | Item bank | Wave 1a + Wave 2 (muscular dystrophy and epilepsy) |
| Applied Cognition | Item bank | Wave 1a + Wave 2 (muscular dystrophy and epilepsy) |
| Stigma | Item bank | Wave 1a + Wave 2 (muscular dystrophy and epilepsy) |

Note.^a We chose not to calibrate *Upper extremity Function* and *Lower extremity Function* because of high skewness in the distributions of these constructs.^b For *Sociability*, we identified two sub-domains, which were different from the original conceptualization: *interaction with peers* and *interaction with adults*. We did not calibrate the latter sub-domain because of poor model fit. Thus, we do not recommend creating a summary score from these items.

Sample sizes:

Note: Some participants were dropped from some IRT analyses due to missing data.

Wave 1a; Participants with epilepsy ($n = 50$) and muscular dystrophy ($n = 9$)

Wave 1b; $N = 513$ general population participants.

Wave 2; Participants with epilepsy ($n = 61$) and muscular dystrophy ($n = 51$)

Item Statistics

Item response theory: An overview. IRT is based on the notion that a person's response to a test item is a function of that person's location on a latent trait.¹⁰ The relationship between performance on an item and a latent trait is described by a mathematical function, which is known as an item characteristic curve. In IRT, the probability of responding to an item in a particular way (e.g., responding "1" for "Never" on a Neuro-QOL item) is a function of the person's level of the latent trait. For most of IRT models, there were five parameters calculated per item: an item slope parameter and four threshold parameters. The number of threshold parameters is equal to the number of response options minus one. The item slope parameter indicates how well an item can discriminate between difference levels of a construct. For that reason, it is sometimes known as a *discrimination parameter*.¹¹ The threshold parameter is related to a point on a continuum at which a person is more likely than not to endorse an item in a particular way. A threshold parameter is sometimes referred to as a *difficulty parameter* because in some analyses they are related to how difficult it is for the items to be endorsed in a particular way. The predicted probability of responding to an item in a particular way is determined by a person's level on a latent trait, as well as the slope and threshold parameters. During our data-analytic phase, we used a process of iterative analysis and discussion with content domain experts, item-by-item level decisions were made as to whether an individual item should be: (1) calibrated and included in the bank, (2) not calibrated but retained for possible future calibration (e.g., items consistent with the domain being measured but having local dependence, responses concentrated in few of the available response options), or (3) excluded from further consideration (e.g. outside of concept; problematic item wording). All models were fit assuming unidimensionality, without local dependence between other items in the bank.

Item response theory models used in Neuro-QOL. Neuro-QOL psychometricians calibrated each item bank using IRT. *Calibration* refers to fitting the items into an IRT model such that its item slope and threshold parameters are estimated. The calibrated item parameters can then be used to underlie computer adaptive tests and inform the creation of short forms. The final Neuro-QOL item banks were calibrated using IRT modeling depending on the sample size. For adults and pediatric generic domains, Samejima's (1997) graded response model was used. For pediatric targeted domains where sample size was less than 200, a 1-PL IRT model was used, in which a common slope parameter was estimated for all items. All IRT analyses were conducted using MULTILOG.

Before fitting IRT models, we examined datasets by examining descriptive statistics such as frequencies and means, as well as statistics based on classical psychometric analyses such as corrected item-total correlations. We also evaluated data quality by assessing an item's response distribution, including a search for out-of-range values. We test IRT model assumptions (monotonicity, unidimensionality/local independence) and model fit (using $S-G^2$ & $S-X^2$) and made modifications to our models as needed.

Tables 3 and 4 present information about the calibration samples for adults and pediatrics, respectively. The tables in the Appendix present the calibrated Neuro-QOL item banks, as well as the list of items that were retained but not calibrated, and the items that were excluded altogether. Items were excluded based on psychometric analyses and the judgment of content experts. In addition to the calibrated item banks, there are additional sets of items grouped into item pools for bowel/bladder function, sexual function, end-of-life concerns, communication difficulty, and interaction with adults (pediatric). Items that met requirements of unidimensionality, but do not fit an IRT model, are treated as "scales" rather than calibrated item banks. The distinction is that whereas a scale can be summed to obtain a total summary score, a calibrated bank can be administered using an array of different short forms, including CAT, to produce a summary score on the same, common metric. Examples of uncalibrated scales include pediatric upper extremity function and pediatric lower extremity function.

Assessment of unidimensionality. For each item pool, we strove to compile lists of items that measured a single construct consistent with the definition of content experts. We conducted formal tests of whether our item pools measured a single dimension. The challenge of dimensionality assessment is to develop approaches to assess

whether a scale has a strong enough general factor so that it is essentially unidimensional. Essential dimensionality (e.g., McDonald, 1981) is defined as the degree to which a test score is influenced by a common factor underlying an item set. No complex item set will ever perfectly meet strictly defined unidimensionality assumptions (see McDonald, 1981); therefore, we sought to confirm that the trait level estimates are predominantly influenced by a general factor. Unidimensionality was examined for each item bank using confirmatory factor analysis guided by fit statistics as well as conceptual input from domain experts. As part of our confirmatory factor analyses, we also assessed *local dependence*, which refers to covariation between two or more items not accounted for by the unidimensional IRT model. Local dependence was assessed by examining the residual correlations between items and then assessing the consequences for model fit when including vs. excluding potentially redundant items.

Differential item functioning. An item displays differential item functioning (DIF) when the probabilities of responding in different categories differ by population for the same underlying level of the attribute. Items were evaluated for DIF by contrasting the IRT parameters across a variety of demographic groups. IRT-based hierarchical ordinal logistic regression (OLR) approach as implemented in LORDIF¹² was used for evaluation of DIF. In this approach a series of logistic models predicting the probability of item response were run and compared. The independent variables in Model 1 are the trait estimate (e.g., raw scale score), group and the interaction between group and trait. Model 2 included main effects of trait and group, and Model 3 included only the trait estimate. Non-uniform DIF was detected if there was a statistically significant difference in the likelihood for Model 1 and Model 2, and uniform DIF is evident if there is a significant difference in the likelihoods for Models 2 and 3. Items flagged for DIF were further discussed before making a final decision with regard to inclusion vs. exclusion.

Neuro-QOL Field Testing and Clinical Validation

Our second phase of field testing was conducted from January 2009 through June 2010. The purpose was to evaluate the reliability, validity and responsiveness of Neuro-QOL short forms and scales in clinical neurology populations. A total of 581 adult and 113 pediatric patients were recruited to reflect the five adult and two pediatric neurological conditions targeted by Neuro-QOL. Proxies for stroke ($N = 84$) and the two pediatric samples ($N = 113$) also completed forms. Administration of Neuro-QOL Short Forms and clinical validation measures (both cross-disease and disease-specific), physician ratings and chart review was conducted at baseline and at a 180-day follow up (to assess responsiveness). Test-retest reliability of the Neuro-QOL Short Forms was evaluated at 7 days. Table 5 lists the number of patients with each respective neurological condition (and proxies) who completed each assessment.

Table 5 – Field Testing/Clinical Validation Sample

| | Number completing assessment | | |
|----------------------------|------------------------------|-------|---------|
| | Baseline | 7-day | 180-day |
| Multiple Sclerosis | 161 | 125 | 132 |
| Parkinson's disease | 120 | 116 | 108 |
| Adult Epilepsy | 119 | 119 | 109 |
| Stroke | 101 | 95 | 90 |
| Stroke Proxies | 84 | 78 | 73 |
| ALS | 80 | 77 | 59 |
| Pediatric Epilepsy | 62 | 60 | 56 |
| Pediatric Epilepsy Proxies | 62 | 60 | 56 |
| Muscular Dystrophy | 51 | 48 | 48 |
| Muscular Dystrophy Proxies | 51 | 48 | 48 |
| Total: | 891 | 826 | 779 |

Methods

Participating Sites. Participants were recruited from several clinical sites, including: Children's Memorial Hospital of Chicago, Cleveland Clinic Foundation, Dartmouth-Hitchcock Medical Center, NorthShore University HealthSystem, Northwestern University Feinberg School of Medicine, Rehabilitation Institute of Chicago, University of California – Davis, University of Chicago, University of Puerto Rico, and University of Texas Health Science Center.

Site Procedures. Each accrual site had a coordinator who assumed overall responsibility for the project at that particular site. All procedures were approved by the NorthShore University HealthSystem Institutional Review Board (IRB) as well as IRBs at each respective institution. Site coordinators identified, enrolled and conducted assessments with eligible participants according to criteria and procedures specified in the Manual of Procedures. Because our goal was to produce a generalizable measurement platform, eligibility criteria were broad. Table 6 lists our general inclusion/exclusion criteria.

Table 6. Clinical Validation Sample Inclusion/Exclusion Criteria

| INCLUSION CRITERIA | | | | | | EXCLUSION CRITERIA |
|--------------------|-----------------|---|----------|----------------------------------|---|--|
| Group | Age | Gender | Language | Diagnosed Neurological Condition | Proxy | |
| Children | Epilepsy: 10-18 | Proportional breakdown of males and females according to incidence rates of respective conditions | English | Epilepsy, Muscular Dystrophy | Proxies (primary care givers) of children with epilepsy or muscular dystrophy | <ul style="list-style-type: none"> • Younger/older than age limits • Non-English speaking • Cognitive impairment that would prevent informed consent and/or completion of test items with the assistance of an interviewer (as determined by recruiting staff). |
| | MD: 10-21* | | | | | |
| Adults | >18 | | | | | |

*Due to the nature and developmental impact of muscular dystrophy, participants may be ≤21 years of age to meet eligibility requirements.

Additional, disease-specific exclusion criteria were: presence of non-epileptic seizures for epilepsy, and being non-community dwelling for stroke.

Recruitment and Testing. Various recruitment methods were utilized including: 1) approaching patients in clinics and 2) mailing letters of invitation to physician-identified patients informing them that someone would contact them about the study at their next clinic appointment. Informed consent or assent (for pediatric participants) was obtained from each subject and covered all three assessments (baseline, 7 days, and 180 days). There was a 5-9 day window for the test-retest assessment and a 5-7 month window for the responsiveness assessment. After a patient was identified and approached, the site coordinator arranged a meeting to introduce and describe the study, confirm eligibility, explain participants' rights, and obtain informed consent and HIPPA authorization if the eligible participant was interested. Site personnel then either administered the baseline evaluation at that time or else scheduled it for another time. Baseline evaluations, consisting of Neuro-QOL instruments, concurrent validity measures, and sociodemographic and clinical data forms, lasted approximately 90 minutes. Some measures, including the Neuro-QOL instruments, were administered by Computer Assisted Self Interview. Other measures were administered by study staff (e.g., performance-based cognitive measures). Medical professional ratings and chart review were also conducted at baseline and as part of the 180-day follow up. Participants were reimbursed according to local IRB-approved standards.

Measures

General Forms

Socio-demographic form. This form provides patient characteristics (e.g., age, gender, race, ethnicity and education). This information was collected at baseline via chart review and/or face-to-face interview.

Clinical information form. This form records disease specific information (e.g., date of diagnosis, treatments) for each participant. It was gathered via chart review and through interviews with patients and/or parents at baseline and 180-day follow-up interviews.

Neuro-QOL Short Forms

All short forms provided raw scores which were converted to T-Scores; with a T = 50 indicating average function compared to the reference population and a standard deviation of 10. Neuro-QOL T-scores referenced to a general population sample are indicated by GPT (General Population T-Score) while those referenced to a clinical sample are indicated by CT (Clinical T-Score).

General Function – Adults Only

Barthel Index. The Barthel Index was developed by Mahoney and Barthel¹³ and is one of the best known and most widely used instruments to assess basic activities of daily living (ADL). The Barthel Index assesses the degree of independence a patient has in performing various self-care and mobility ADL tasks. The weighted ordinal scale assesses 10 items of ADL in the following subgroups: personal care (including eating), dressing, personal hygiene and bathing, continence of urine and stool, mobility (including transfer from a bed and toilet), walking, and steps. The index has high test-retest reliability ($r=0.89$), inter-rater reliability ($r>0.95$), (Granger, Albrecht, & Hamilton, 1979) and internal consistency (Cronbach's alpha = 0.98). (Shinar et al., 1987) We administered this by standardized interview.

Instrumental Activities of Daily Living Scale. The Lawton Instrumental Activities of Daily Living Scale,¹⁴ is an interviewer administered measure which includes 8 items: telephoning, shopping, food preparation, housekeeping, laundry, transportation, medications, and handling finances. Each task is graduated in a 3- or 4-level scale. The scale measures performance in contrast to ability.

General Function – Adults and Children

Karnofsky Performance Status Scale (KPSS).¹⁵ The KPSS is a rating of functional impairment and offers a simple if coarse breakdown of activity level across patients regardless of diagnosis. KPSS criteria are based on descriptive categories from 0-100. Ratings were made by providers.

Cognitive Function – Adults and Children

Oral Digit Symbol Modalities.¹⁶ This is a test of speed of information processing, but is also thought to assess visual acuity and figural memory. A timed coding task using a key as reference, examinees pair specific numbers (0-9) with designated geometric figures that are matched up in the key; examinees attempt to complete as many matches as quickly as possible in 90 seconds. Written and oral forms are highly correlated (in normal adults $>.78$). Because some participants may have greater motor deficits compared to others, we administered the oral version.

Symbol Search.¹⁷ A test of mental speed, this is a timed orthographic measure of visual attention, scanning, and motor speed. Participants must determine if a target nonsense figure is present in a string of figures and mark a corresponding "yes" or "no" box presented at the end of each item.

Digit Symbol Coding.¹⁷ This is a timed paper/pencil symbol substitution task of mental, visual and motor speed. Using a key of paired numbers and symbols, participants must draw corresponding nonsense symbols below rows of numbers.

Health Related Quality of Life – Adults (including proxies) and Children

EQ-5D.^{18,19} This is a 15-item self-report measure of health status developed by the EuroQoL Group in order to provide a simple, generic measure of HRQL for clinical and economic appraisal. Applicable to a wide range of health conditions and treatments, it provides a simple descriptive profile and a single index value for health status. Domains include: mobility, self-care, usual activities, pain/discomfort and anxiety/depression.

PROMIS Global Health Scale.²⁰ Global health refers to evaluations of health in general rather than specific elements of health. The PROMIS global health items include global ratings of the five primary PROMIS domains (physical function, fatigue, pain, emotional distress, social health) and general health perceptions that cut across domains. It can be scored into a Global Physical Health component and Global Mental Health component. Global items allow respondents to weigh together different aspects of health to arrive at a ‘bottom-line’ indicator of their health status. Global health items have been found to be consistently predictive of important future events such as health care utilization and mortality.

Global HRQL Question.²¹ A single item from the Functional Assessment of Chronic Illness Therapy (FACIT), “I am content with the quality of my life right now,” was used as a global measure of quality of life.

Health Related Quality of Life – Children and Pediatric proxies

Pediatric Quality of Life Inventory, Multidimensional Fatigue Scale (PedsQL™-MFS)^{22,23} The PedsQL - MFS is a self-report measure consisting of both a general quality of life measure (PedsQL™) and a fatigue specific measure (MFS). The PedsQL™ is designed to measure core health dimensions in children from 2 to 18 years old. The measure consists of 23 items in four scales: physical functioning, emotional functioning, social functioning, and school functioning. Children/Teens completed a self-report assessment. Proxies completed the parent/caregiver form. The MFS consists of 18 items across three domains: general fatigue (6 items), sleep/rest fatigue (6 items), and cognitive fatigue (6 items).

Pain – Adults (including proxies) and Children

Pain question. A single (0-10) item that asks patients to rate, from “none” (0) to “the worst pain you can think of (“10”), the severity of their worst pain during the past week.

Responsiveness – Adults and Children

Karnofsky Performance Status Scale (KPSS).¹⁵ Described above.

Global rating of change. This measurement strategy assumes that a patient can judge whether over the course of a specified period, their self-reported health status has changed. Typically, such questions require patients to remember a prior health state and compare it to how they are currently feeling.^{24,25} In this study, participants were asked to rate how much their Physical, Emotional, Cognitive, Social/Family and Symptomatic Well-being and their overall quality of life had changed over the past 6 months according to the following scale: +3 = “Very much better” to -3 = “Very much worse”. Such global transition ratings have the advantage of being easy to interpret and they enhance the interpretability of HRQL scores when found to be correlated with the target instrument. For instance, if the correlation between a global rating of change and the change score on a target instrument is over 0.5, the validity of the target instrument is supported. Global transition ratings have been widely used in HRQL outcome assessments to augment the interpretation of HRQL scores.²⁶⁻²⁸ Proxies completed a proxy version of this measure.

Statistical Analyses

The following analyses were conducted for all clinical groups.

7. Means, standard deviations, and other distributional statistics were calculated for all scores at the baseline and follow-up assessments.
8. Internal consistency reliability - Internal consistency analyses were performed for each short form using Cronbach’s alpha coefficients.
9. Test-retest reliability - Intraclass correlation coefficients and corresponding 95% confidence intervals were calculated to assess the test-retest reliability of the Neuro-QOL measures using the baseline and 7-day assessments.
10. Concurrent validity was assessed at baseline by Spearman rho correlations between Neuro-QOL short forms and disease-specific and cross-disease measures.
11. Known groups validity was evaluated at baseline by comparing mean Neuro-QOL short form scores between patients grouped by clinical anchors such as disease severity. Analysis of variance (ANOVA) was used to test for differences between groups. Effect sizes (mean difference / pooled standard deviation) were calculated to aid in interpretation of group differences.
12. Responsiveness -To demonstrate the sensitivity of the Neuro-QOL measures for detection of change, we evaluated general linear models using each patient’s change score. We conducted responsiveness analyses on the Neuro-QOL banks using several criteria for change. One criterion used across all adult conditions was the Karnofsky Performance Status, and another was the self-reported Global Rating of Change (GRC) described above. Here we report the results from the GRC-based change. Beginning with the 7-level GRC (range: +3= very much better; 0 = about the same; -3 = very much worse), we collapsed the three “better” categories into one, and the three “worse” categories into one, leaving three categories (“better;” “about the same;” “worse”). These three categories were compared using one-way analysis of variance followed by least significant difference testing of adjacent groups when the overall F statistic was significant. For each analysis, we required that at least 5 patients be represented in each of these three categories. If fewer than five patients were represented in a category, it was collapsed with the adjacent category and the two remaining groups were compared using a t-test. There were six GRC questions. Five of them queried patients specifically about change in Physical well-being, Cognitive Well-Being, Emotional well-being, Social/Family Well-being, and Disease-related Symptoms. The sixth GRC item asked about overall quality of life. The list below indicates which of the 13 adult item bank change scores were compared across GRC categories:

| | |
|-----------------------|---|
| Physical well-being: | Upper Extremity and Lower Extremity Function; Fatigue; Sleep Disturbance |
| Cognitive well-being: | Applied Cognition (General Concerns and Executive Function) |
| Emotional well-being: | Depression; Anxiety; Stigma; Positive Affect and Well-Being; Emotional and Behavioral Dyscontrol |
| Social well-being: | Social Function (Ability to Participate in Social Roles and Activities and Satisfaction with Social Roles and Activities); Stigma |
| Symptoms: | Fatigue; Sleep Disturbance; Emotional and Behavioral Dyscontrol; Depression; Anxiety |
| Overall: | ALL |

This resulted in 32 planned comparisons for adult clinical validation sample (no adjustment made for multiple comparisons). Results for these responsiveness analyses are presented below. Only those that achieved statistical significance will be summarized.

Disease-specific Measures and Results

STROKE

Disease-Specific Measures

Stroke Specific Quality of Life (SS-QOL) scale.(Williams, Weinberger, Harris, Clark, & Biller, 1999) The SSQOL is a 49 item self-report measure containing domains of energy, family roles, language, mobility, mood, personality, self-care, social roles, thinking, vision, upper extremity function and work-productivity. Items are scored on a 5-point Likert scale. Although relatively new, initial psychometric properties are good.

The American Heart Association Stroke Outcome Classification (AHA.SOC).^{29,30}The AHA.SOC score provides a mechanism to comprehensively document stroke impairments and disabilities in a single summary stroke score. The system can be used by healthcare providers to reliably assess recovery, measure responses to treatment, and describe the long-term impact of stroke on survivors.

Results

Sample characteristics. 101 subjects were recruited from 5 centers. Participants were primarily male (55%), white (73%), and non-Hispanic (90%) with average age=59 years (SD=14). Fifty-seven percent were married, 73% had a high school or greater education. Thirteen percent were retired, 33% on disability and 19% were employed either full or part time. Average time post-stroke was 5.4 years (SD=5), with 22% reporting no or minimal deficits, 58% mild/moderate deficits and 20% severe deficits. The primary stroke type was an infarction (71%).

As shown in Table 7, respondents reported worse cognitive and physical function and social well-being than the general population reference group, but more positive affect and well-being. When compared to a clinical reference group, they reported less depression, fatigue and sleep disturbance, better emotional and behavior control and average stigma.

Reliability: Table 7 shows that the internal consistency and 1 week test-retest reliability of the short forms is high, with Cronbach's alphas ranging from .78 to .95 and ICCs ranging from .73 to .94.

Table 7. Descriptive and reliability statistics for Neuro-QOL short form T-scores

| Neuro-QOL Short Form | N_{items} | $N_{persons}$ | M_{GPT} | M_{CT} | SD | α | T-R ICCs** |

*p < .05; **p < .01; ***p < .001

Known groups validity: AHA severity level was used to split the sample into 3 groups: no/minimal neurological deficit; mild/moderate neurological deficit; severe neurological deficit. These groups differed significantly on all Neuro-QOL short forms except Anxiety, Fatigue, Sleep Disturbance and Emotional and Behavioral Dyscontrol. Effect sizes ranged from $-.68$ to 2.55 .

Responsiveness: Of the 32 planned comparisons, 15 were statistically significant and one exhibited a trend toward significance, in the predicted direction.

Physical Well-Being: Of the four planned comparisons [Lower Extremity Function-Mobility, Upper Extremity Function - Fine Motor, ADL, Fatigue, and Sleep Disturbance] three were statistically significant, all in the predicted direction. Specifically, significant differences were observed in Lower Extremity Function – Mobility between patients who reported worsening at six months with those who reported improving in this domain ($F=6.11$, $p<.01$). Similarly, significant differences were observed in Upper Extremity Function - Fine Motor, ADL ($F=6.83$, $p<.01$) and Sleep Disturbance ($F=4.08$, $p<.05$) between patients who reported worsening at six months and those who reported staying the same or improving in this domain.

Social/Family Well-Being: Of the three planned comparisons [Ability to Participate in Social Roles and Activities, Satisfaction with Social Roles and Activities, Stigma] all three were statistically significant in the predicted direction. Specifically, significant differences were observed in Ability to Participate in Social Roles and Activities ($F=3.76$, $p<.05$) and Stigma ($F=6.67$, $p<.01$) among patients who reported staying the same or improving in these domains. Similarly, significant differences were observed in Satisfaction with Social Roles and Activities ($F=5.86$, $p<.01$) between patients who reported worsening at six months and those who reported staying the same or improving in this domain.

Emotional Well-Being: Of the five planned comparisons [Depression, Anxiety, Emotional and Behavioral Dyscontrol, Stigma, Positive Affect and Well-being] four were statistically significant, all in the predicted direction. Specifically, statistically significant differences were observed between patients who reported worse Anxiety at six months with those who reported the same levels in this domain ($F=3.42$; $p<.05$). Similarly, significant differences were observed in Depression ($F=13.53$, $p<.01$), Stigma ($F=6.88$, $p<.01$) and Positive Affect and Well-being ($F=6.35$, $p<.01$) between patients who reported worsening at six months and those who reported staying the same or improving in these domains.

Cognitive Well-Being: Of the two planned comparisons [Applied Cognition – General Concerns, Applied Cognition – Executive Function] neither short form exhibited statistically significant changes or trends toward significance over time.

Symptomatic Well-Being: Of the five planned comparisons [Fatigue, Sleep Disturbance, Emotional and Behavioral Dyscontrol, Depression, Anxiety] one was statistically significant in the predicted direction. Specifically, differences were observed in Sleep Disturbance at six months between patients who reported worsening, staying the same and improving in this domain ($F=3.49$; $p<.05$).

Overall Quality of Life: Of the thirteen planned comparisons [all Neuro-QOL short forms] one exhibited a trend toward significance, and four were statistically significant, all in the predicted direction. Specifically, a trend toward statistical significance was observed between patients who reported worse Sleep Disturbance at six months with those who reported staying the same or improving in these domains ($F=5.45$, $p<.01$). In addition, statistically significant differences were observed between patients who reported worse Depression ($F=8.28$, $p<.01$), Stigma ($F=4.44$, $p<.01$), Positive Affect and Well-being ($F=2.98$, $p=.06$) and Lower Extremity Function – Mobility ($F=4.02$, $p=.02$) at six months with those who reported staying the same or improving in these domains.

Conclusions

- The validity of the Neuro-QOL measures for adults with stroke is supported with satisfactory internal consistency, test-retest reliability and significant correlations with many external validity measures.
- All Neuro-QOL short forms except Applied Cognition (Executive Function and General Concerns) were responsive to self-reported change in conceptually-related aspects of well-being.

AMYOTROPHIC LATERAL SCLEROSIS (ALS)

Disease-specific measures

Amyotrophic Lateral Sclerosis Assessment Scale (ALSAQ³¹⁻³³) The ALSAQ is comprised of 40 items across 5 subscales tapping the major domains affected by ALS. The subscales include physical mobility, activities of daily living, eating and drinking, communication and emotional functioning. All 40 items can also be summed together to obtain a total score for ALS QOL. Recently, the scale authors published data on the score differences that might be considered to meaningfully differentiate between subgroups or within groups of subjects over time.³⁴ This makes the ALSAQ particularly valuable for evaluating the convergent validity and responsiveness of the Neuro-QOL item banks.

Amyotrophic Lateral Sclerosis Functional Rating Scale-Revised (ALSFERS-R³⁵). The original scale, the ALSFRS, has 10 items that assess activities of daily living, such as speech, swallowing, handwriting, and dressing and hygiene that are specifically affected by the disease. In 1999, three additional items were added to better assess respiratory function. Both the original and revised versions have been used successfully as clinical trial outcome measures.³⁶ Because of the importance of respiratory problems in the ALS population, we administered the 12-item ALSFRS-R.

Results

Sample characteristics: Participants (N=80) were primarily male (65%), white (94%), and non-Hispanic (98%) with average age=59 years (SD=12.3). Seventy-six percent were married, 46% had a college or advanced degree. Thirty-one percent were retired, 33% on disability, 17% were employed full- and 6% were employed part time. Average time since diagnosis was 2.0 years (SD=3.6). The mean ALSFRS-R score = 32.0 (SD=8.6) with range = 8-48.

Mean T-Scores and standard deviations on the short forms are shown in Table 10. ALS patients reported significantly worse physical and social function compared to a general population reference group but similar cognitive function and more positive affect. When compared to a clinical neurological reference group, they showed greater stigma, less sleep disturbance, fatigue, depression, and emotional and behavioral dyscontrol and similar anxiety.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 10. Cronbach's alphas range from .80 to .96 and ICCs from .49 to .93.

*p < .05; **p < .01; ***p < .001

Known groups validity: In the baseline assessment, the extent to which ALS patients agreed with the statement "I am content with my quality of life right now" was significantly associated with the following Neuro-QOL short forms: Depression, Anxiety, Positive psychological functioning, Social role - participation, Social role - satisfaction, and Fatigue. The corresponding effect sizes ranged from .22 to 2.86.

Responsiveness: Of the 32 planned comparisons, 4 were statistically significant and 1 exhibited a trend toward significance, all in the predicted direction.

Physical Well-being: Of the four planned comparisons, one was significant. Specifically, patients who reported a worsening of their physical well-being showed significantly worse Upper Extremity Function scores than those who reported no change ($t=2.17$; $p<.05$).

Cognitive Well-being: Of the two planned comparisons, one was significant. Patients with worsening cognitive well-being reported significantly worsening executive function compared to those who did not have a change in cognitive well-being ($t=3.22$; $p<.01$).

Emotional Well-being: Of the five planned comparisons, one was significant. Patients who reported decreasing emotional well-being showed increased scores on the Depression Short Form ($F=3.30$; $p<.05$).

Social/Family Well-being: Of the three planned comparisons, none were significant.

Symptomatic Well-being: Of the five planned comparisons, none were significant.

Overall Quality of Life: Of the thirteen planned comparisons, one was significant and one approached significance. Specifically, patients who reported a decrease in overall quality of life also showed significant worsening of upper extremity function ($t=3.17$; $p<.05$) and a trend toward increasing fatigue ($t=-1.68$; $p<.10$).

Conclusions:

- The study sample represented a wide range of functioning, similar to an ALS clinic population
- Internal consistency was high for 11, and adequate for 2, of the 13 Neuro-QOL scales
- The Intraclass Correlation Coefficients (ICC) ranged from .49 (satisfaction with social roles) to .94 (mobility), suggesting that further evaluation of test-retest reliability is warranted in some cases.
- Convergent and discriminant validity appear to be excellent, with correlations of the expected strength and in the expected direction
- Several Neuro-QOL short forms (Upper Extremity Function, Applied Cognitive –Executive Function, and Depression) demonstrated responsiveness to self-reported change. The remaining short forms did not.

MULTIPLE SCLEROSIS (MS)

Disease-Specific Measures

Functional Assessment of Multiple Sclerosis (FAMS). The FAMS was developed by Cella and Aarnoson and includes 44 questions, divided into six subscales: mobility, symptoms, emotional well-being (depression), general contentment, thinking/fatigue, and family/social well-being. Fifteen un-scored questions are included because of their clinical value.

Multiple Sclerosis Functional Composite Measure (MSFC). The MSFC was developed as an outcome measure by the National MS Society's Clinical Outcomes Assessment Task Force to address the poor reliability and sensitivity of available MS rating scales.³⁷ The MSFC consists of three objective quantitative tests of neurological functioning : arm, leg and cognitive function. Arm function is assessed with the nine-hole peg test; leg function with the timed 25-foot walk, and cognitive function with the Paced Auditory Serial Addition Test (PASAT) (being substituted with Oral Symbol Digit test for this study). The MSFC correlates with MRI parameters,³⁸⁻⁴⁰ measures of disability,⁴¹⁻⁴³ and has predictive validity.^{42,44,45} MSFC scores are sensitive to change.^{37,46} It demonstrates excellent intra-rater (ICC =.97) and inter-rater (ICC =0.95 - 0.96) reliability^{42,47} for technicians trained with standardized procedures. Scores on the three MSFC components are transformed into Z scores, and then combined into a total MSFC Z score, providing a continuous scale of measurement.

The MS Performance Scales is a medical professional reported measure of MS-related disability. The Performance Scales measure disability in eight domains of function: mobility, hand function, vision, fatigue, cognition, bladder/bowel, sensory, and spasticity. The construct and criterion validity of the subscales of the Performance Scales has been established.⁴⁸

Results

Sample characteristics. Participants (N=161) were primarily female (86%), white (88%), and non-Hispanic (93%) with average age=49.8 years (SD=10.5). 58.4% were married, 90% had some college or a college degree. Thirty-seven percent were on disability and 34% were employed full time. MSFC scores ranged from -2.90 to 1.7, with mean=0.0 (SD=.69). Mean MS Performance Scale score = 16.04 (SD=9.18; range = 0-35).

Mean T-Scores and standard deviations on the short forms are shown in Table 13. MS patients reported worse physical, social and cognitive function compared to a general population reference group but greater positive affect. When compared to a clinical neurological reference group, they showed less depression and better emotional and behavioral control but similar levels of stigma, sleep disturbance, fatigue and anxiety.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 13. Cronbach's alphas range from .81 to .95 and ICCs from .67 to .89.

Table 13. Descriptive and reliability statistics for Neuro-QOL short form T-scores

Known groups validity: Patients grouped according to MSFC quartile scored significantly differently on all Neuro-QOL SFs, except Anxiety, Depression, and Emotional & Behavioral Dyscontrol, with effect sizes ranging from .47 to 2.15.

Responsiveness: Of the 32 planned comparisons, 18 were statistically significant and 3 exhibited a trend toward significance, in the predicted direction.

Physical Well-being: Of the four planned comparisons, one was significant and one exhibited a trend toward significance, both in the predicted direction. Specifically, patients who reported a worsening of their physical well-being showed worsening of scores on Physical Function – Lower Extremity (extended assessment; $F=4.36$; $p<.05$) and a trend toward worse fatigue ($F=2.36$; $p<.10$).

Cognitive Well-being: Of the two planned comparisons, both were significant and in the predicted direction. Patients who reported worsening cognitive well-being showed worsening of their cognitive function, both in terms of general concerns ($F=7.09$; $p<.01$) and executive function ($F=4.69$; $p<.01$).

Emotional Well-being: Of the five planned comparisons, four were significant and one showed a trend toward significance in the predicted direction. Patients who reported worsening emotional well-being also reported increased depression ($F=14.82$; $p<.0001$), anxiety ($F=7.28$; $p<.01$) and emotional and behavioral dyscontrol ($F=3.19$; $p<.05$) and decreased positive affect and well-being. Patients who reported increased emotional well-being showed a trend toward scoring lower on the Stigma Short Form ($F=2.61$; $p<.10$).

Social/Family Well-being: Of the three planned comparisons, one was significant. Specifically, patients who reported improved social/family well-being at 6 months also reported decreasing stigma ($F=3.21$, $p<.05$).

Symptomatic Well-being: Of the five planned comparisons, three were significant. Patients who reported worsened symptomatic well-being showed worsening on the Depression Short Form ($F=5.02$; $p<.01$). Patients who reported improved symptomatic well-being showed decreased fatigue ($F=6.45$; $p<.01$) and improved emotional and behavioral control ($F=3.14$; $p<.05$).

Overall Quality of Life: Of the thirteen planned comparisons, seven were significant and one showed a trend toward significance. Patients who reported decreased overall quality of life also showed worsening depression ($F=8.99$; $p<.001$), anxiety ($F=5.57$; $p<.05$), ability to participate in social roles and activities ($F=3.91$; $p<.05$) and a trend toward decreased upper extremity function ($F=2.51$; $p<.10$).

Conclusions

- The study sample was generally representative of MS clinic populations
- The 13 Neuro-QOL scales demonstrated high internal consistency
- The Intraclass Correlation Coefficients (ICC) were acceptable, ranging from .67 (anxiety) to .89 (lower extremity)
- Convergent validity with generic and legacy measures was good; correlations were of the expected strength and direction and short forms discriminated between patients grouped according to disease severity.
- There is some initial evidence for Neuro-QOL short form responsiveness to self-reported change in MS patients, particularly for the short forms assessing emotional and cognitive well-being, where 4 of 5 and 2 of 2 planned comparisons were significant.

PARKINSON'S DISEASE

Disease-specific measures

Montreal Cognitive Assessment (MoCA).⁴⁹ Designed as a rapid screening instrument for mild cognitive dysfunction, it assesses different cognitive domains: attention and concentration, executive functions, memory, language, visuoconstructional skills, conceptual thinking, calculations, and orientation. Scores range from 0-31, with scores below 26 considered abnormal.

Parkinson's disease Questionnaire-39 (PDQ-39).^{50,51} The thirty nine items of this self-report measure assess eight dimensions: mobility, activities of daily living, emotional well-being, bodily discomfort, stigma, social support cognition and communication. Scale and summary scores are available, ranging from 0-100, with higher scores indicating greater problems.

Unified Parkinson's Disease Rating Scale (UPDRS).⁵² The UPDRS is the most widely used measure of disability and impairment associated with PD. It is a composite scale consisting of 4 parts: Mentation, Behavior and Mood (UPDRS mental score); ADLs (UPDRS ADL score), Motor Function (motor score); and Complications of therapy. The first 3 subscales are quantitative five point scales (0-4). The complications of therapy is a yes/no scale. For this study, UPDRS Motor Function scoring was modified as follows: only the most affected side or body part was rated. All ratings were made by physicians or other medical personnel.

Hoehn and Yahr staging.⁵³ The Hoehn and Yahr staging consists of 5 disease severity categories ranging from 0.0 (no signs of disease) to 5.0 (wheelchair bound or bedridden unless aided). The staging was obtained through chart review or through direct contact with the patient's physician or other medical personnel.

Patient Health Questionnaire-9 (PHQ-9).⁵⁴ This is a 9-item subset of the PHQ, and assesses self-reported depression. The nine items of the PHQ-9 come directly from the nine DSM-IV signs and symptoms of major depression.

Results

Sample characteristics: Participants were primarily male (62%), white (95%), and non-Hispanic (97%) with average age=65. Seventy-four percent were married, 55% had a college or advanced degree. Fifty-eight percent were retired and 20% were employed either full or part time. Most (76%) were in mild stages of the disease: Hoehn and Yahr 1 (N=19; 16%), 2 (N=72; 60%), 3 (N=23; 19%), 4 (N=6; 5%). Average time since PD diagnosis was 7.1 years. 80% were taking L-Dopa either alone or in combination with other anti-PD medications and 9% reported undergoing prior PD surgery. A majority of patients (55%) were primarily affected on their right side; most experienced no (43%) or little (33%) activity limitation due to motor fluctuations.

Mean T-Scores and standard deviations on the Neuro-QoL short forms are shown in Table 16. PD patients reported worse cognitive, physical and social function compared to a general population reference group but more positive affect and well-being. When compared to a clinical neurological population, they showed less sleep disturbance, fatigue and depression and a greater sense of emotional and behavioral control.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 16. Cronbach's alphas range from .82 to .94 and ICCs from .80 to .89.

*p ≤ .05; **p ≤ .01; ***p ≤ .001

Known groups validity: Patients in H & Y Stage 1 or 2 scored significantly differently on all Neuro-QOL SFs, except Applied Cognition-General Concerns and Emotional & Behavioral Dyscontrol, than did patients in Stages 3 or 4, with effect sizes ranging from .5 to 1.11.

Responsiveness: Of the 32 planned comparisons, 7 were statistically significant and 1 exhibited a trend toward significance, in the predicted direction.

Physical Well-being: Of the four planned comparisons, two were significant in the predicted direction. Specifically, patients who reported a worsening of their physical well-being showed worsening of scores on Fatigue (F=8.13; $p<.01$) Lower Extremity Function (extended assessment; F=4.69; $p<.05$).

Cognitive Well-being: Of the two planned comparisons, none were significant.

Emotional Well-being: Of the five planned comparisons, one showed a trend toward significance. Patients who reported changes in emotional well-being also exhibited a trend toward having changes in positive affect and well-being.

Social/Family Well-being: Of the three planned comparisons, none were significant.

Symptomatic Well-being: Of the five planned comparisons, one was significant. Specifically, patients who reported worsening symptomatic well-being also demonstrated worsening scores on Fatigue (extended assessment; F=3.32; $p<.05$).

Overall Quality of Life: Of the thirteen planned comparisons, four were significant. Patients who reported a worsening of overall quality of life showed decreasing positive affect and well-being (F=6.73; $p<.01$), ability to participate in social activities (F=4.04; $p<.05$), and upper extremity function (F=5.33; $p<.01$) and increasing fatigue (extended assessment, F=3.63; $p<.05$).

Conclusions:

- The Neuro-QOL measures demonstrated high internal consistency and test-retest reliability.
- Convergent validity was supported by correlations with generic and PD-specific measures in the expected directions. Correlations were generally modest in strength, warranting additional validation in PD samples. Neuro-QOL measures showed good discrimination between patients at different levels of disease severity.
- There was only limited evidence for responsiveness to self-reported changes in different domains of well-being.

ADULT EPILEPSY

Disease-Specific Measures

Quality of Life in Epilepsy-31(QOLIE-31).^{55,56} The QOLIE-31 is an HRQL survey for adults (>18) with epilepsy. Derived from the QOLIE-89, this scale contains domains that include seizure worry, emotional wellbeing, energy/fatigue, cognition, medication effects, social effects, health status and overall quality of life. Good psychometric evidence has been reported in previous studies.

Liverpool Seizure Severity Scale (LSSS). The LSSS is a 12 item scale that assesses experiences during and immediately after a seizure such as loss of consciousness and post-ictal confusion. Each item is scored on a Likert scale, with higher scores indicating greater seizure severity. Reported test retest reliabilities range from 0.74 – 0.80.^{57,58} A modified scoring system requires patients to rate only their most severe seizure and demonstrates adequate reliability, construct validity and responsiveness to change.⁵⁹

Liverpool Adverse Events Profile (LAEP).⁶⁰ The LAEP is a 19 item self-report scale that assesses the frequency of antiepileptic drug side effects. Using a 4-point Likert scale (1= never a Problem – 4=always a problem), scores are summed to create a total score (ranging from 19-76, higher scores indicating more symptoms).

Results

Sample characteristics. Participants were primarily male (51%), white (85%), and non-Hispanic (75%) with average age=47.3 (Range = 18-93). Forty-seven percent were married, 67% had some college or beyond. Fourteen percent were retired, 22% on disability and 37% were employed either full or part time. Average time since epilepsy diagnosis was 18.5 years (SD=13.9). Generalized seizures were most frequently experienced (57%) followed by focal seizures (25%). Mean number of seizures in the past 3 months = 10.7 (SD=37.6). 95% were taking medication for their seizure disorder, with 64% of those on polytherapy. Twelve percent had undergone surgery for their epilepsy.

Mean T-Scores and standard deviations on the short forms are shown in Table 19. Epilepsy patients reported significantly worse cognitive and social function compared to a general population reference group but similar levels of physical function and greater positive affect and well-being. When compared to a clinical neurological population, they showed similar levels of stigma, greater anxiety, but less depression, sleep disturbance, fatigue, and sense of emotional and behavioral dyscontrol.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 19. Cronbach's alphas range from .86 to .96 and ICCs from .57 to .89.

* =p< .05; ** = p< 0.01

Known groups validity: Statistically significant known group differences were observed between Leeds Seizure Severity Scale quartile groups and the following Neuro-QOL short forms: Anxiety ($F=5.15$, $p<.01$), Depression ($F=5.71$, $p<.01$), Emotional and Behavioral Dyscontrol ($F=4.32$, $p<.01$), Fatigue ($F=9.08$, $p<.01$), Positive Affect and Well-being ($F=6.3$, $p<.01$), Sleep Disturbance ($F=3.36$, $p<.01$), Stigma ($F=4.65$, $p<.01$) and Upper Extremity - Fine Motor, ADL ($F=4.07$, $p<.01$).

Responsiveness: Of the 32 planned comparisons, nine were statistically significant and five exhibited a trend toward significance, in the predicted direction.

Physical Well-Being: Of the four planned comparisons [Lower Extremity Function-Mobility, Upper Extremity Function - Fine Motor, ADL, Fatigue, and Sleep Disturbance] two were statistically significant and one exhibited a trend toward significance, all in the predicted direction. Specifically, a trend toward significance was observed between patients who reported worse Physical Function – Lower Extremity at six months with those who reported better functioning ($F=2.74$; $p=.069$). Statistically significant differences were observed between patients who reported worsening at six months with those who reported staying the same or improving in both Fatigue ($F=4.94$; $p<.01$) and Sleep Disturbance ($F=3.21$, $p<.05$).

Social/Family Well-Being. Of the three planned comparisons [Ability to Participate in Social Roles and Activities, Satisfaction with Social Roles and Activities, Stigma] one exhibited a trend toward significance, in the predicted direction. Specifically, a trend toward significance was observed between patients who reported worse Ability to Participate in Social Roles and Activities at six months with those who reported improvements in this domain ($F=2.64$; $p=.076$).

Emotional Well-Being. Of the five planned comparisons [Depression, Anxiety, Emotional and Behavioral Dyscontrol, Stigma, Positive Affect and Well-being] three were statistically significant and one exhibited a trend toward significance, all in the predicted direction. Specifically, a trend toward significance was observed between patients who reported worse Anxiety at six months with those who reported improvements in this domain ($F=2.62$; $p=.077$). Statistically significant differences were observed between patients who reported worse Depression at six months with those who reported improvements in this domain ($F=4.94$; $p<.01$); between patients who reported the same level of Emotional and Behavioral Dyscontrol with those who reported improvements in this domain ($F=3.19$, $p<.05$); and between patients who reported improved Positive Affect and Well-being with those who reported staying the same or worsening in this domain ($F= 7.40$, $p<.01$).

Cognitive Well-Being. Of the two planned comparisons [Applied Cognition – General Concerns, Applied Cognition – Executive Function] neither short form exhibited statistically significant changes or trends toward significance over time.

Symptomatic Well-Being. Of the five planned comparisons [Fatigue, Sleep Disturbance, Emotional and Behavioral Dyscontrol, Depression, Anxiety] one was statistically significant in the predicted direction. Specifically, differences were observed between patients who reported worse Depression at six months with those who reported staying the same or improving in this domain ($F=3.94$; $p<.05$).

Overall Quality of Life. Of the thirteen planned comparisons [all Neuro-QOL short forms] two were statistically significant and three exhibited a trend toward significance, all in the predicted direction. Specifically, a trend toward significance was observed between patients who reported staying the same and those who reported improving in their scores of Emotional and Behavioral Dyscontrol ($F=3.07$, $p=.051$), Anxiety ($F=2.97$, $p=.056$), Fatigue ($F=2.92$, $p=.058$), and Ability to Participate in Social Roles and Activities ($F=2.86$, $p=.061$). Statistically significant differences were observed between patients who reported worse Depression over time with those who reported staying the same or improving in this domain ($F=3.71$; $p<.05$). Significant differences were also

observed between patients who reported improvements in Positive Affect and Well-being at six months compared to those who reported staying the same or worsening in this domain ($F=6.39$, $p<.01$).

Conclusions:

- The 13 Neuro-QOL scales demonstrated high internal consistency, ranging from .86 (Sleep disturbance) to .96 (Depression)
- The Intraclass Correlation Coefficients (ICC) were generally acceptable, ranging from .57 (Ability to Participate in Social Roles and Activities) to .89 (Lower Extremity Function – Mobility)
- Convergent and discriminant validity were good, with correlations of the expected strength and in the expected direction. Neuro-QOL measures discriminated between patients at different levels of disease severity.
- There is initial evidence of responsiveness. Self-reported changes in physical, emotional and symptomatic well-being and overall quality of life were reflected in significant changes in conceptually-related Neuro-QOL short forms.

PEDIATRIC EPILEPSY

Sample characteristics. Participants (N=61) were primarily male (62.3%), white (75.9%), and non-Hispanic (75.4%) with average age=13.4 (SD=2.6; range = 10 to 18). At baseline, 17.8% reported having seizures daily, 13.3% weekly, 35.6% monthly and 33.3% yearly, and all patients were taking anti-epilepsy drugs at the time of testing.

Mean T-Scores and standard deviations on the short forms are shown in Table 22. Pediatric epilepsy patients reported better function/less symptoms on all domains compared to the reference group.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 22. Cronbach's alphas range from .76 to .87 and ICCs from .44 to .94.

Known groups validity: Patients with different seizure frequency (daily, weekly, monthly and yearly) scored significantly differently on Anxiety and Applied Cognition-General Concerns, with $F=3.36$, $p=0.025$ and $F=3.05$, $p=0.0358$, respectively.

Responsiveness:

Similar to adult patients, we conducted responsiveness analyses on the Neuro-QoL banks using the Karnofsky Performance Status and the self-reported Global Rating of Change (GRC). Here we report the results from the GRC-based change. Beginning with the 7-level GRC (range: +3= very much better; 0 = about the same; -3 = very much worse), we collapsed the three “better” categories into one, and the three “worse” categories into one, leaving three categories (“better;” “about the same;” “worse”). These three categories were compared using one way analysis of variance followed by least significant difference testing of adjacent groups when the overall F statistic was significant. For each analysis, we required that at least 5 patients be represented in each of these three categories. If fewer than five patients were represented in a category, it was collapsed with the adjacent category and the two remaining groups were compared using a t-test. There were six GRC questions. Five of them queried patients specifically about change in Physical well-being, Cognitive well-being, Emotional well-being, Social/Family well-being, and Symptomatic Well-being (Disease-related Symptoms). The sixth GRC item asked about overall quality of life.

The following indicates which of the 9 pediatric item bank change scores were compared across GRC categories:

| | |
|-----------------------|--|
| Physical well-being | Physical Function (Upper extremity and Lower extremity); Fatigue; Pain |
| Cognitive well-being: | Applied Cognition - General Concerns |
| Emotional well-being: | Depression; Anxiety; Stigma; |
| Social well-being: | Social Relation- Interaction with peers; Stigma |
| Symptoms: | Fatigue; Depression; Anxiety; Pain |
| Overall: | ALL |

This resulted in 23 planned comparisons for each wave two clinical validation sample (no adjustment made for multiple comparisons). Results for these responsiveness analyses are presented below. Only those that achieved statistical significance will be summarized.

Of the 23 planned comparisons, two were statistically significant.

Emotional Well-being: Of the three planned comparisons, stigma was statistically significant ($F=3.24$, $p<0.05$). Post hoc comparisons showed that patients who reported a change (either better or worse) in Emotional Well-being at 6-month follow-up also reported higher stigma than did patients who reported no change in Emotional Well-being, effect size=0.53 and 0.78, respectively.

Social Well-being: Of the two planned comparisons, Stigma was found to be statistically significant ($t=2.02$; $p<.05$). Yet, the direction was unexpected. Patients who reported better Social Well-being at 6-months had more stigma than those who reported that their Social Well-Being was unchanged, with an effect size of 0.57.

Conclusions:

- The current sample was generally high functioning.
- The 9 Neuro-QOL measures demonstrated high internal consistency. The Intraclass Correlation Coefficients (ICC) were acceptable, ranging from .44 (Stigma) to .94 (Upper Extremity Function- Fine motor, ADL)
- Convergent validity associations with generic and legacy measures were of the expected strength and direction
- Responsiveness was not as good as we expected. It is hypothesized that this was due to the high functioning samples recruited in the testing with only a few patients reporting that they were getting worse at the 6-month follow-up.

MUSCULAR DYSTROPHIES

Sample characteristics. Patients (N=51) were primarily male (84.3%), white (58.8%), and non-Hispanic (62.7%) with average age=16.3 (SD=3.4; range=10.1 to 21.9). Seventy-seven percent were full time students, 2% were in school part time, and 4% were employed part-time. Of them, 5.9% (n=3) reported falling daily, 9.8% (n=5) weekly, 9.8% (n=5) monthly, 19.6% (n=10) rarely fall, yet 54.9% (n=28) were unable to ambulate without a wheelchair. One patient reported previous spine fracture, 11 (22%) limb fractures, and 17 (33.3%) received lower extremity or orthopedic surgeries before.

Mean T-Scores and standard deviations on the short forms are shown in Table 25. MD patients generally reported better functioning/ less symptom severity than the reference group norm with one exception. The exception was the Social Relations – Interactions with Peers Short Form, on which MD patients scored about 2.5 T-scores worse than the norm.

Reliability: Internal consistency and 1 week test-retest reliability of the short forms is shown in Table 25. Cronbach's alphas range from .81 to .98 and ICCs from .61 to .97.

Table 25. Pediatric MD - Descriptive and reliability statistics for Neuro-QOL short form T-scores

| Neuro-QOL Measures | N_{items} | $N_{persons}$ | M_{GPT} | M_{CT} | SD | α | T-R** ICCs |
|---|-------------|---------------|-----------|----------|-------|----------|------------|
| Social Relations – Interactions with Peers* | 8 | 50 | 47.42 | | 10.15 | .90 | .87 |
| Applied cognition: general concerns* | 8 | 49 | | 54.38 | 6.70 | .81 | .81 |
| Depression | 8 | 51 | 46.27 | | 8.77 | .92 | .61 |
| Anxiety | 8 | 51 | 50.25 | | 7.45 | .85 | .70 |
| Stigma | 8 | 51 | | 49.29 | 7.26 | .92 | .60 |
| Fatigue | 8 | 51 | | 46.56 | 8.46 | .81 | .65 |
| Pain | 10 | 51 | | 49.58 | 8.76 | .92 | .73 |
| Lower Extremity (Mobility)* ^{NOTE} | 20 | 22 | 54.02*** | | 23.05 | .90 | .65 |
| Upper Extremity (Fine Motor, ADL) * | 20 | 51 | 53.63*** | | 36.13 | .98 | .97 |

* For these banks, a high score indicates better function; for all other banks a high score indicates worse function

** Time 1 (baseline) vs. Time 2 (7-days)

*** These two scales were not calibrated using Item Response Theory models due to skewed distributions. Possible scores range from 0 -100

M_{GPT} – Mean General Population T-Score; M_{CT} – Mean Clinical T-Score

^{NOTE} 28 patients (54.9%) reported using wheelchair only and had missing data on the Lower Extremity Function scale. When assigned “unable to do” for these patients on the Lower Extremity Function items, mean = 23.73.

*p < .05; **p < .01; ***p < .001

Convergent Validity: The global quality of life item “I am content with the quality of my life right now” (20.4% -Not at all or A little bit; 44.9% - Somewhat or Quite a bit; 34.7% - Very much) was used to evaluate the convergent validity of the pediatric Neuro-QOL measures. Depression, Anxiety, Applied Cognition-General Concerns and Social Relation-Interaction with Peers were statistically significant, $F=7.32$ ($p=0.02$), 3.51 ($p=0.038$), 3.59 ($p=0.036$) and 6.10 ($p=0.005$), respectively. Post-hoc comparisons showed that all significant comparisons were in the predicted direction, with effect size range from 0.75 to 1.58.

Responsiveness: Same 23 planned comparisons as described in pediatric epilepsy were conducted. Results for these responsiveness analyses are presented below. Only those that achieved statistical significance will be summarized.

Of the 23 planned comparisons, two were statistically significant.

Emotional Well-being: Of the three planned comparisons, Depression and Stigma were statistically significant, $t= -2.29$ ($p=0.027$) and $t=-2.38$ ($p=0.022$), respectively. Specifically, patients who reported “better” Emotional Well-being reported less depression and less stigma than those who reported it as remaining “the same”. As less than 5 patients reported worsened Emotional Well-being at 6-month follow-up, these patients were grouped with “the same”.

Conclusions:

- The 9 Neuro-QOL measures demonstrated high internal consistency (alpha range from 0.81-0.98).
- The Intraclass Correlation Coefficients (ICC) were acceptable, ranging from .60 (Stigma) to .97 (Upper Extremity Function- Fine motor, ADL)
- Convergent validity with generic and legacy measures were of the expected strength and direction
- Depression and Sigma were sensitive to change in Emotional Well-being change over time.

General Conclusions/Discussion

This report summarizes the procedures and initial findings from the Neuro-QOL clinical validation field testing. Overall, the Neuro-QOL short forms demonstrated excellent internal consistency across all diseases. Test-retest reliability was acceptable, but varied between disease groups. It was uniformly high for stroke, PD and MS, but a few short forms had lower than expected ICCS when used with ALS, adult and pediatric epilepsy, and muscular dystrophy patients. Validity of the Neuro-QOL short forms and scales was supported by 1). correlations with generic and disease-specific measures that were of the expected strength and direction; 2). Ability of the short forms to discriminate between patients grouped by disease severity level or other clinical factor.

For Further Information

Additional IRT statistics and analyses have been delivered to the NINDS as electronic attachments.

Neuro-QOL instruments are freely available at www.neuroqol.org. Publications, other future reports, and supplemental data will also be posted on this website.

| Neuro-QOL Item Name | PROMIS Item Name | Item Content | Rating Scale |
|------------------------|---------------------|---|--|
| NQASD10 | | How much DIFFICULTY do you currently have descending 3-5 stairs without a handrail with your walking aid? | 5 = No Difficulty 4 = A Little Difficulty 3 = Some Difficulty 2 = A Lot of Difficulty 1 = Can't Do |
| NQASD11 | | How much difficulty do you currently have going for a walk of at least 15 minutes with your walking aid? | 5 = Without any difficulty 4 = With a little difficulty 3 = With some difficulty 2 = With much difficulty 1 = Unable to do |
| NQASD12 | | Are you able to get in and out of a car with your walking aid? | 5 = Without any difficulty 4 = With a little difficulty 3 = With some difficulty 2 = With much difficulty 1 = Unable to do |
| NQASD13 | | Are you able to get in and out of a car from a wheelchair? | 5 = Without any difficulty 4 = With a little difficulty 3 = With some difficulty 2 = With much difficulty 1 = Unable to do |

APPENDIX B- Neuro-QoL Technical Report Version 1.0

Table 32: IRT parameters for the *Fatigue* item bank

For each item, item context was *In the past 7 days*, and the rating scale was *1 = Never; 2 = Rarely; 3 = Sometimes; 4 = Often; 5 = Always*

| Neuro-QoL Item Name | Item Stem | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|---------------------|--|------------|-------------|-------------|-------------|-------------|
| NQFTG01 | I needed help doing my usual activities because of my fatigue. | 2.72 | -0.68 | 0.00 | 0.94 | 1.86 |
| NQFTG02 | I had to limit my social activity because I was tired. | 3.61 | -0.75 | -0.13 | 0.75 | 1.91 |
| NQFTG03 | I needed to sleep during the day. | 1.89 | -1.20 | -0.41 | 0.84 | 1.88 |
| NQFTG04 | I had trouble starting things because I was too tired. | 3.84 | -0.92 | -0.25 | 0.82 | 1.88 |
| NQFTG05 | I had trouble finishing things because I was too tired. | 3.74 | -1.05 | -0.30 | 0.80 | 1.92 |
| NQFTG06 | I was too tired to do my household chores. | 4.24 | -0.96 | -0.25 | 0.66 | 1.67 |
| NQFTG07 | I was too tired to leave the house. | 3.94 | -0.60 | 0.05 | 0.94 | 1.91 |
| NQFTG08 | I was too tired to take a short walk. | 2.97 | -0.68 | -0.09 | 0.69 | 1.57 |
| NQFTG09 | I was too tired to eat. | 2.71 | -0.20 | 0.69 | 1.81 | 2.72 |
| NQFTG10 | I was frustrated by being too tired to do the things I wanted to do. | 4.15 | -0.72 | -0.24 | 0.43 | 1.17 |
| NQFTG11 | I felt that I had no energy. | 4.58 | -1.18 | -0.42 | 0.33 | 1.30 |
| NQFTG12 | I was so tired that I needed to rest during the day. | 3.52 | -1.11 | -0.38 | 0.62 | 1.42 |
| NQFTG13 | I felt exhausted. | 4.68 | -0.93 | -0.25 | 0.60 | 1.42 |
| NQFTG14 | I felt tired. | 3.99 | -1.64 | -0.74 | 0.31 | 1.34 |
| NQFTG15 | I felt fatigued. | 4.53 | -1.30 | -0.47 | 0.41 | 1.37 |
| NQFTG16 | I felt weak all over. | 3.13 | -0.66 | 0.04 | 0.89 | 1.69 |
| NQFTG17 | I needed help doing my usual activities because of weakness. | 3.30 | -0.27 | 0.36 | 1.20 | 2.09 |
| NQFTG18 | I had to limit my social activity because I was physically weak. | 3.29 | -0.28 | 0.36 | 1.04 | 1.85 |
| NQFTG20 | I had to force myself to get up and do things because I was physically too weak. | 3.15 | -0.36 | 0.26 | 1.04 | 2.01 |

The *Fatigue* Item Bank had only one uncalibrated item: (NQFTG19) I had enough physical strength to do the things I wanted to do.

Table 33: IRT parameters for the *Sleep Disturbance* item bank

For each item, the item context was *In the past 7 days*, and the rating scale was 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*

| Neuro-QOL Item Name | Item Stem | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|------------------------|--|------------|-------------|-------------|-------------|-------------|
| NQSLP02 | I had to force myself to get up in the morning. | 1.59 | -0.59 | 0.32 | 1.33 | 2.29 |
| NQSLP03 | I had trouble stopping my thoughts at bedtime. | 2.30 | -0.59 | 0.14 | 1.03 | 2.00 |
| NQSLP04 | I was sleepy during the daytime. | 1.60 | -1.82 | -0.77 | 0.69 | 1.95 |
| NQSLP05 | I had trouble sleeping because of bad dreams. | 1.67 | 0.53 | 1.57 | 2.53 | 3.52 |
| NQSLP07 | I had trouble falling asleep. | 2.24 | -0.62 | 0.28 | 1.26 | 2.15 |
| NQSLP12 | Pain woke me up. | 1.34 | 0.05 | 0.84 | 2.00 | 3.45 |
| NQSLP13 | I avoided or cancelled activities with my friends because I was tired from having a bad night's sleep. | 2.47 | 0.50 | 1.12 | 2.09 | 2.97 |
| NQSLP18 | I felt physically tense during the middle of the night or early morning hours. | 1.80 | 0.57 | 1.13 | 2.31 | 3.76 |

Table 34: Uncalibrated items for the *Sleep Disturbance* item bank

For each item, the item context was *In the past 7 days*, and the rating scale was 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*

| Neuro-QoL Item Name | Item Stem |
|---------------------|--|
| NQSLP19 | During the night I was awakened by stiffness and had trouble getting back to sleep. |
| NQSLP20 | I had restless feelings in my legs in the evening or night. |
| NQSLP08 | I had an urge to move my legs when I was sitting still or lying down. |
| NQSLP09 | My legs jerked or twitched repeatedly during sleep. |
| NQSLP10 | I experienced numbness or tingling in my arms or legs which woke me from sleep at night. |
| NQSLP14 | I had hallucinations at night (seeing or hearing things that do not exist). |
| NQSLP16 | I screamed during sleep. |
| NQSLP17 | I kicked, punched, or swung my arms during sleep. |

Table 35: Items excluded from the *Sleep Disturbance* item bank

For each item, the item context was *In the past 7 days*, and the rating scale was 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*

| Neuro-QoL Item Name | PROMIS Item Name | Item Stem |
|---------------------|------------------|---|
| NQSLP01 | Sleep50 | I woke up too early and could not fall back asleep. |
| NQSLP06 | Sleep87 | I had trouble staying asleep. |
| NQSLP11 | | I experienced tremor upon waking. |
| NQSLP15 | | Taking medicine helped me sleep. |

APPENDIX B- Neuro-QoL Technical Report Version 1.0

Table 36: IRT parameters for the *Depression* item bank

For each item, the item context is *In the past 7 days*, and the response scale is 1 = *Never*; 2 = *Rarely*; 3 = *Sometimes*; 4 = *Often*; 5 = *Always*.

| Neuro-QOL Item Name | Item Content |
|----------------------------|---|
| NQPER03 | It was hard to keep up enthusiasm to get things done. |
| NQPER04 | My problems seemed unimportant to me. |

APPENDIX B- Neuro-QoL Technical Report Version 1.0

Table 46: IRT parameters for the *Applied Cognition – General Concerns* item bank.

For each item, the item context is *In the past 7 days*, and the response scale is 5= *Never*; 4= *Rarely (once)*; 3= *Sometimes (2-3 times)*; 2= *Often (once a day)*; 1= *Very Often (several times a day)*

| Neuro-QOL Item Name | Item Stem | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|---------------------|---|------------|-------------|-------------|-------------|-------------|
| NQCOG46 | I made simple mistakes more easily. | 2.65 | -2.70 | -2.04 | -1.13 | -0.26 |
| NQCOG53 | Words I wanted to use seemed to be on the “tip of my tongue”. | 2.31 | -2.20 | -1.60 | -0.73 | 0.16 |
| NQCOG64 | I had to read something several times to understand it. | 2.88 | -2.28 | -1.82 | -1.09 | -0.30 |
| NQCOG65 | I had trouble keeping track of what I was doing if I was interrupted. | 3.56 | -2.30 | -1.75 | -1.05 | -0.37 |
| NQCOG66 | I had difficulty doing more than one thing at a time. | 3.42 | -2.20 | -1.71 | -1.06 | -0.42 |
| NQCOG67 | I had trouble remembering whether I did things I was supposed to do, like taking a medicine or buying something I needed. | 2.81 | -2.35 | -1.90 | -1.17 | -0.33 |
| NQCOG68 | I had trouble remembering new information, like phone numbers or simple instructions. | 2.91 | -2.44 | -1.85 | -1.21 | -0.50 |
| NQCOG69 | I walked into a room and forgot what I meant to get or do there. | 2.32 | -2.50 | -1.76 | -0.89 | 0.16 |
| NQCOG70 | I had trouble remembering the name of a familiar person. | 1.80 | -3.10 | -2.45 | -1.42 | -0.45 |
| NQCOG72 | I had trouble thinking clearly. | 4.13 | -2.27 | -1.81 | -1.10 | -0.52 |
| NQCOG73 | I reacted slowly to things that were said or done. | 4.11 | -2.50 | -1.98 | -1.27 | -0.64 |
| NQCOG74 | I had trouble forming thoughts. | 4.28 | -2.43 | -1.94 | -1.27 | -0.68 |
| NQCOG75 | My thinking was slow. | 4.37 | -2.40 | -1.82 | -1.13 | -0.54 |
| NQCOG77 | I had to work really hard to pay attention or I would make a mistake. | 4.53 | -2.16 | -1.74 | -1.17 | -0.58 |
| NQCOG80 | I had trouble concentrating. | 3.76 | -2.12 | -1.60 | -0.96 | -0.30 |
| NQCOG83 | I had trouble getting started on very simple tasks. | 3.03 | -2.41 | -1.85 | -1.21 | -0.64 |
| NQCOG84 | I had trouble making decisions. | 3.29 | -2.43 | -1.89 | -1.25 | -0.61 |
| NQCOG86 | I had trouble planning out steps of a task. | 3.84 | -2.49 | -1.98 | -1.43 | -0.79 |

APPENDIX B- Neuro-QoL Technical Report Version 1.0

Table 47: Uncalibrated items for the *Applied Cognition – General Concerns* item bank.

For each item, the item context is *In the past 7 days*, and the response scale is 5= *Never*; 4= *Rarely (once)*; 3= *Sometimes (2-3 times)*; 2= *Often (once a day)*; 1= *Very Often (several times a day)*

| Neuro-QOL Item Name | Item Content |
|---------------------|---|
| NQCOG43 | I got confused, for example, I did not know where I was. |
| NQCOG44 | I had difficulty paying attention for a long period of time. |
| NQCOG45 | I felt like my mind went blank. |
| NQCOG47 | After I made a mistake, I got stuck and couldn't figure out a new way to go. |
| NQCOG48 | "I had trouble recognizing my mistakes right away |
| NQCOG49 | I had trouble saying what I mean in conversations with others. |
| NQCOG50 | I was told that I start talking before the other person finishes. |
| NQCOG51 | I was told that I repeat myself. |
| NQCOG52 | I was a worse listener than usual |
| NQCOG54 | I had trouble finding the right word(s) to express myself. |
| NQCOG55 | I used the wrong word when I referred to an object. |
| NQCOG56 | I communicated by gestures, for example, moving my head, pointing or sign language. |
| NQCOG57 | My speech was understood only by a few people who know me well. |
| NQCOG58 | I had to repeat myself so others could understand me. |
| NQCOG59 | I slurred or stuttered while speaking. |
| NQCOG60 | I had to talk very slowly to make myself understood. |
| NQCOG62 | I had trouble recalling the name of an object. |
| NQCOG63 | I had trouble recognizing familiar words on a page. |
| NQCOG71 | I forgot to do things like turn off the stove or turn on my alarm clock. |
| NQCOG76 | My thinking was confused. |
| NQCOG78 | I had trouble adding or subtracting numbers in my head. |
| NQCOG79 | I made mistakes when writing down phone numbers. |
| NQCOG81 | I had trouble spelling words correctly when writing. |
| NQCOG82 | I had trouble keeping track of the day or date. |
| NQCOG85 | When I had something to do that takes a long time, I had trouble deciding where to start. |
| NQCOG87 | I needed medical instructions repeated because I could not keep them straight. |
| NQCOG88 | When I was reading I needed to use a ruler or my finger to keep track of which line I was on. |

One item – (NQCOG61) My speech was difficult for others to understand – was excluded from the bank altogether.

APPENDIX B- Neuro-QoL Technical Report Version 1.0

Table 48: IRT parameters for the *Applied Cognition –Executive Function* item bank.

For each item, the item context is *How much DIFFICULTY do you currently have...*, and the response scale is 5= None; 4= A little; 3= Somewhat; 2= A lot; 1= Cannot Do

| Neuro-QOL Item Name | Item Stem | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|---------------------|---|------------|-------------|-------------|-------------|-------------|
| NQCOG15 | keeping track of time (eg., using a clock)? | 2.47 | -3.71 | -2.86 | -2.21 | -1.59 |
| NQCOG16 | checking the accuracy of financial documents, (e.g., bills, checkbook, or bank statements)? | 3.30 | -2.63 | -2.18 | -1.79 | -1.06 |
| NQCOG17 | counting the correct amount of money when making purchases? | 2.59 | -3.22 | -2.72 | -2.28 | -1.67 |
| NQCOG22 | reading and following complex instructions (e.g., directions for a new medication)? | 2.43 | -3.75 | -2.51 | -1.87 | -1.04 |
| NQCOG24 | planning for and keeping appointments that are not part of your weekly routine, (e.g., a therapy or doctor appointment, or a social gathering with friends and family)? | 3.51 | -3.25 | -2.32 | -1.75 | -1.03 |
| NQCOG25 | managing your time to do most of your daily activities? | 2.78 | -3.27 | -2.25 | -1.63 | -0.71 |
| NQCOG26 | planning an activity several days in advance (e.g., a meal, trip, or visit to friends)? | 3.37 | -3.17 | -2.43 | -1.84 | -1.15 |
| NQCOG27 | taking care of complicated tasks like managing a checking account or getting appliances fixed? | 3.68 | -2.59 | -2.08 | -1.64 | -0.96 |
| NQCOG28 | keeping important personal papers such as bills, insurance documents and tax forms organized? | 3.18 | -2.55 | -1.93 | -1.45 | -0.70 |
| NQCOG31 | getting things organized? | 3.04 | -2.91 | -1.98 | -1.45 | -0.56 |
| NQCOG38 | remembering where things were placed or put away (e.g., keys)? | 2.11 | -3.71 | -2.09 | -1.36 | -0.15 |
| NQCOG39 | remembering a list of 4 or 5 errands without writing it down? | 2.15 | -2.70 | -1.82 | -1.13 | 0.05 |
| NQCOG40 | learning new tasks or instructions? | 2.43 | -4.22 | -2.39 | -1.47 | -0.37 |

APPENDIX B- Neuro-QoL Technical Report Version 1.0

Table 49: Uncalibrated items for the *Applied Cognition –Executive Function* item bank.

For each item, the item context is *How much DIFFICULTY do you currently have...*, and the response scale is 5= *None*; 4= *A little*; 3= *Somewhat*; 2= *A lot*; 1= *Cannot Do*

| Neuro-QOL Item Name | Item Content |
|---------------------|--|
| NQCOG05 | making yourself understood to familiar people over the phone? |
| NQCOG06 | making yourself understood to other people during ordinary conversations? |
| NQCOG07 | describing something that has happened to you so that others can understand you? |
| NQCOG09 | putting words together to form grammatically correct sentences? |
| NQCOG12 | reading simple material (e.g., a menu or the TV or radio guide)? |
| NQCOG13 | reading the newspaper or magazine? |
| NQCOG14 | understanding information on food labels? |
| NQCOG18 | doing calculations in your head while shopping (e.g., 30% off, etc.)? |
| NQCOG19 | using information on the bill to figure out where to call if you have a problem? |
| NQCOG20 | carrying on a conversation with a familiar person in a noisy environment (e.g., at a party or meeting)? |
| NQCOG21 | following a series of dialing instructions (e.g., a recorded message "Press 1 for...")? |
| NQCOG23 | looking up a phone number or address in the phone book? |
| NQCOG29 | handling an unfamiliar problem (e.g., getting the refrigerator fixed)? |
| NQCOG30 | planning for and completing regularly scheduled weekly tasks, such as taking out the trash or doing laundry? |
| NQCOG32 | planning what to do in the day? |
| NQCOG33 | explaining how to do something involving several steps to another person? |
| NQCOG34 | using a local street map to locate a new store or doctor's office? |
| NQCOG35 | dialing familiar numbers such as a family member or doctor (without losing your place or misdialing)? |
| NQCOG36 | reading a long book (over 100 pages) over a number of days? |
| NQCOG37 | remembering to take medications at the appropriate time? |
| NQCOG41 | using a map to tell where to go? |
| NQCOG42 | understanding pictures that explain how to assemble something? |

Table 50: Excluded items for the *Applied Cognition –Executive Function* item bank.

For each item, the item context is *How much DIFFICULTY do you currently have...*, and the response scale is 5= *None*; 4= *A little*; 3= *Somewhat*; 2= *A lot*; 1= *Cannot Do*

| Neuro-QOL Item Name | Item Content |
|----------------------------|---|
| NQCOG01 | writing notes to yourself, such as appointments or 'to do' lists? |
| NQCOG02 | composing a brief note or e-mail to someone? |
| NQCOG03 | understanding familiar people during ordinary conversations? |
| NQCOG04 | understanding family and friends on the phone? |
| NQCOG08 | carrying on a conversation with a small group of familiar people (e.g., family or a few friends)? |
| NQCOG10 | organizing what you want to say? |
| NQCOG11 | speaking clearly enough to use the telephone? |

Table 51: IRT parameters for the *Ability to Participate in Social Roles and Activities* item bank.

For each item, the item context is *In the past 7 days*; for *non-reversed items* the rating scale is 1 = Never; 2 = Rarely; 3 = Sometimes; 4 = Often 5 = Always. For *reversed items* the rating scale is 5 = Never; 4 = Rarely; 3 = Sometimes; 2 = Often; 1 = Always

| Neuro-QOL Item Name | Item Stem | Rating Scale | Item slope | Threshold 1 | Threshold 2 | Threshold 3 | Threshold 4 |
|---------------------|--|--------------|------------|-------------|-------------|-------------|-------------|
| NQPRF01 | I can keep up with my family responsibilities. | | 3.87 | -2.28 | -1.66 | -0.98 | -0.37 |
| NQPRF02 | I have trouble meeting the needs of my family. | Reversed | 2.97 | -2.06 | -1.58 | -0.84 | -0.14 |
| NQPRF03 | I am able to do all of my regular family activities. | | 4.53 | -1.88 | -1.44 | -0.80 | -0.28 |

| NQMOBped31 | 2202R2 | I could walk across the room. | 3 = With no trouble 2 = With a little trouble 1 = With some trouble/ With a lot of trouble/Not able to do |
| NQMOBped32 | | I could walk while wearing a backpack full of books. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped33 | 676R1 | I could bend over to pick something up. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped35 | | I could do exercise that others my age can do. | 4 = With no trouble; 3 = With a little trouble; 2 = With some trouble 1 = With a lot of trouble/Not able to do |

Table 69: Items excluded from the pediatric *Lower Extremity Function (Mobility)* scale.

For each item, the item context is *In the past 7 days...*

APPENDIX B- Neuro-QoL Technical Report Version 1.0

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|---------------------|---|---|
| NQMOBped01 | I could keep my balance while walking for 30 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped06 | I could run as fast as others my own age. | 4 = not at all 3 = a little bit 2 = somewhat 1 = quite a bit/very much |
| NQMOBped07 | I could get on and off the toilet. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped10 | I could get in and out of an adult-sized chair. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped11 | I could get on and off a chair without using my arms. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped12 | I could walk for 30 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped15 | I could sit on a bench without back support for 30 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped16 | I could keep my balance while walking for 15 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped19 | I could turn my head all the way to the side to look at someone or something. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped22 | I lose my balance easily. | 4 = not at all 3 = a little bit 2 = somewhat 1 = quite a bit/very much |
| NQMOBped23 | I have trouble keeping up with other kids my age when walking. | 4 = not at all 3 = a little bit 2 = somewhat |

APPENDIX B- Neuro-QoL Technical Report Version 1.0

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|--|---|
| | | 1 = quite a bit/very much |
| NQMOBped27 | I could run for 15 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped28 | I could run for 30 minutes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped34 | I could do sports that others my age can do. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped36 | I could carry bags (such as shopping bags) while going up a full flight of stairs. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped37 | I could carry bags (such as shopping bags) while going down a full flight of stairs. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped38 | I could ride a bicycle. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQMOBped39 | I could walk up 2-3 stairs. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |

Table 70: Items for the *Upper Extremity Function (Fine motor, Activities of Daily Living)* pediatric scale.

For each item, the item context is *In the past 7 days...* .

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|---------------------|--|---|
| NQUEXped03 | I was able to use my fingers to point to something. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUEXped04 | I was able to take off my socks. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUEXped05 | I was able to put on and fasten my pants by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUEXped06 | I was able to button and unbutton my shirt. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUEXped11 | I was able to use a spoon to bring food up to my mouth. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUEXped13 | I was able to wipe myself thoroughly after using the toilet. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUEXped14 | I was able to pull my pants back up after using the toilet. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUEXped15 | I was able to hold a plate full of food. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUEXped19 | I was able to cut a piece of paper in half with scissors. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUEXped24 | I was able to take a shower by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |

Table 71: Items excluded from the *Upper Extremity Function (Fine motor, Activities of Daily Living)* pediatric scale.

APPENDIX B- Neuro-QoL Technical Report Version 1.0

For each item, the item context is *In the past 7 days...*

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|---------------------|--|---|
| NQUExp25 | I was able to take a bath by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp29 | I was able to make a phone call using a touch tone key-pad. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp30 | I was able to get out of bed by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp32 | I was able to put on my shoes by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp33 | I was able to open a jar by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp34 | I was able to put toothpaste on my toothbrush by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp35 | I was able to brush my teeth by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp38 | I was able to dry my back with a towel. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp40 | I was able to put on my clothes by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp41 | I was able to zip up my clothes. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp01 | I was able to open small containers like snack bags or vitamins (regular screw top). | 4 = With no trouble 3 = With a little trouble 2 = With some trouble |

APPENDIX B- Neuro-QoL Technical Report Version 1.0

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|---|---|
| NQUExped02 | I was able to wash and dry my hands without help. | 1 = With a lot of trouble/Not able to do 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExped07 | I was able to unzip my pants. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExped08 | I was able to hold a full cup of water in my hand. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExped09 | I was able to wash my hair without help. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExped10 | I was able to lift a cup of water to my mouth without spilling. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExped12 | I was able to use a knife to spread butter or jelly on bread. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExped16 | I was able to carry a tray of food in a cafeteria or restaurant. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExped17 | I was able to pick up a gallon of milk with one hand and set it on the table. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExped18 | I was able to get in and out of a tub without help. | 4 = Never 3 = Almost Never 2 = Sometimes 1 = Often/Almost Always |
| NQUExped20 | I was able to style my hair by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExped21 | I was able to cover my nose when sneezing. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |

APPENDIX B- Neuro-QoL Technical Report Version 1.0

| Neuro-QoL Item Name | Item Stem | Rating Scale |
|------------------------|--|---|
| NQUExp22 | I was able to use a computer mouse. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp23 | I was able to open a can of soda. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp26 | I was able to change positions in my bed. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp27 | I was able to write a short note by using a pencil or pen. | 4 = Never 3 = Almost Never 2 = Sometimes 1 = Often/Almost Always |
| NQUExp28 | I was able to communicate with friends using e-mail or text messaging. | 4 = Never 3 = Almost Never 2 = Sometimes 1 = Often/Almost Always |
| NQUExp31 | I was able to get into bed by myself. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp36 | I was able to pull open heavy doors. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |
| NQUExp37 | I was able to open the rings in school binders. | 4 = With no trouble 3 = With a little trouble 2 = With some trouble 1 = With a lot of trouble/Not able to do |

Higher scores indicate more of that domain. A T-Score distribution has a mean of 50 and standard deviation of 10. SE is on the T-score metric and computed based on the Fisher information conditional on T-score. Reliability is approximated based on the conditional SE.

Table 73: Neuro-QOL Item Bank Calibration Sample T-Score Means and Standard Deviations, and Distributions by Percentile

| Social relations – Interaction with Peers | 16 | 513 | 50.09 | 9.68 | 35.50 | 38.04 | 43.38 | 49.28 | 56.52 | 63.54 | 67.12 |
| Anger | 8 | 513 | 49.91 | 9.59 | 35.61 | 35.61 | 43.33 | 49.91 | 57.31 | 61.55 | 66.17 |

- T-score means, standard deviations and T-scores by percentile are computed for the calibration sample to describe this sample.

Figure 1. Precision of the item banks across the measurement continuum compared to sample distribution. Area in blue represents the range with a reliability $\geq 95\%$ while the area in yellow represents the range with of reliability between 0.9 and 0.95.

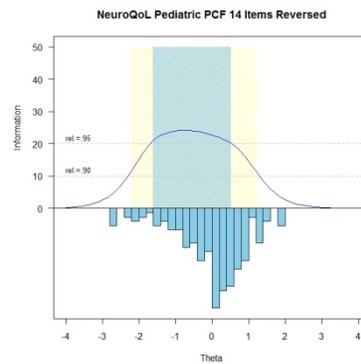

Figure 1f. Fatigue

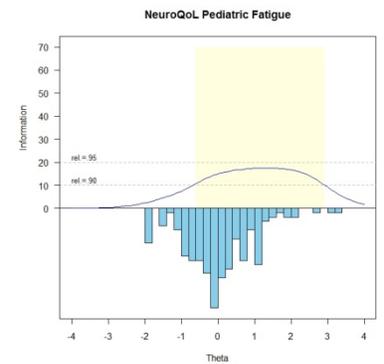

Figure 1g. Pain

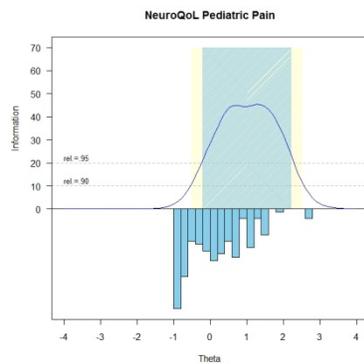

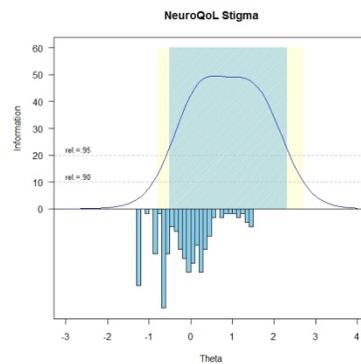

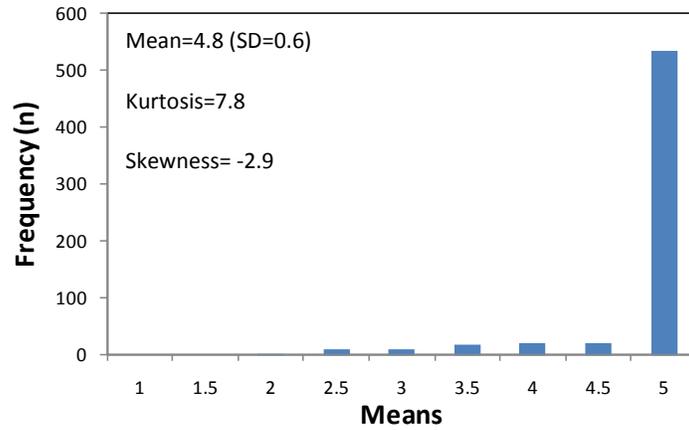

Figure 1h. Stigma

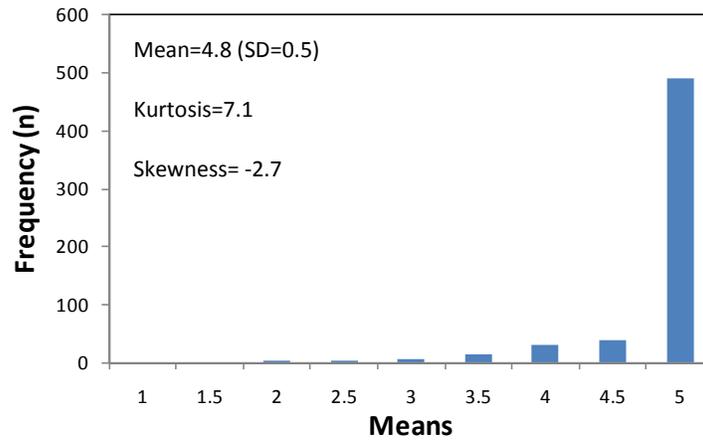

NOTE: Precision information is not available for “Upper Extremity (ADL)” and “Lower Extremity (Mobility)” scales as these scales cannot be calibrated using IRT analyses.

Figure 2. Distributions of Upper and Lower Extremity Function Scales (in raw score unit). Possible scores range from 1 to 5 and higher scores represent better function.

a. Upper Extremity Function

b. Lower Extremity Function
